WIN £25,000 AND SAVE THE WORLD

Eureka!

**250 K OF PURE MYSTERY
BY IAN LIVINGSTONE**

- 5 complete Adventures in one computer game, in one multi-level mega-program. "Eureka!" is the ultimate computer Epic.
- Epic in scope. "Eureka!" spans over 5,000 years! You battle against the diabolous cult of Medusa, his ghouls, spin the Knights of the Round Table escape from Calabria, and finally into 1984 orbit of the evil master of the Caribbean who is holding the world to ransom.
- Epic in sheer size — there's more than 250K for you to get yourself killed in.

5 PROGRAMS IN ONE

- All 5 Adventures are linked — but you can choose to play them separately. And they all have REAL TIME built in! So if you don't think fast, you wind up as a plesiotrody's lunch, die of over-exertion in a Roman arena or just lose your mind.
- "Eureka!" is not just an Epic — not just an Adventure. At the start of each historical era, you face an Arcade Action test, to decide your strength level for the Adventure to come.
- The better your score, the stronger and faster you'll be.
- And if I keep you on your toes, with constantly changing, static and moving graphics. Brilliant music and sound effects add to the excitement.
- As part of the "Eureka!" pack, you receive a full-colour illustrated booklet, containing cryptic riddles and mysterious illustrations. Using booklet and screen together, you steadily unravel the clues and build up a secret phone number, pass by pieces.
- If you're lucky to ring in, you save the world and collect the £25,000!
- Quite a package? Are we giving away your last chance. "Eureka!" will be released simultaneously worldwide October 31st, 1984. No packs will be available until that date. All orders received by mail or phone by 26th OCTOBER will be despatched by post on the 31st right across the world. So order now, and be one of the first off the mark.

THEN THE RACE IS ON!!!

DEvised BY IAN LIVINGSTONE

The storylines for "Eureka!" are by Ian Livingstone, who has written over 50 books and sold over 2,000,000 copies. He has drawn up some rather nasty traps and I warn you in there's Epic, because he has also devised the cryptic clues and conundrums in the booklet that goes with the program. He's the one who knows the answers.

"Eureka!" was programmed by Andromeda teams led by Huntington Donet, Kass and Andros Colicos. It took the equivalent of 5 YEARS to create and the skills of 4 graphic artists, 2 programmers and a professor of logic to pull it off. We told them to stretch me hardware capabilities one more time so you were kept awake for hours! They've done it.

News:

New products new software and anything that's news to Commodore users.

6

The Forth Dimension: Programming with a DIY language – part two

Forth aficionado Richard Huxley continues his series on that most do-it-yourself of computer languages. This month: initiating conversations between the reader and the Forth system in your computer.

13

Up, up and away: Flight Simulators reviewed

Flight simulation programs for the Commodore 64 are all the rage right now. This month, we cast a critical eye over some of the more popular flight packages. Will any of them turn you into a budding Riggles?

15

Six rules for better programs

Chris Preston starts a new series to help you write better programs. He lays the foundations by giving a set of simple but essential rules for you to follow.

22

Control your home with Vic and 64 – part two:

Chris Durham continues his interesting series by expanding and modifying the control unit he introduced last month. You did build it didn't you? Also included is a Basic control program, for both Vic and 64.

26

Taskset in profile: The view from Bridlington

Taskset has devoted itself to producing games almost exclusively for the Commodore 64. And it's managed to gain a reputation for using the 64's graphics and sound capabilities to the full. Michael Bacak took the Seaside Special to Bridlington to meet the creators of Rankin, Rodney and Jones.

35

Screen scene for Vic:

Vic Virtuals:

This month's offerings include a version of the classic 'Breakout' routine for screen scrolling and a hi-res plotting program.

42

Speedy disk access: The 1541 Express reviewed

The 1541 Express cartridge from Ram Electronics claims to double the speed of your rather sluggish 1541 disk drive. Kevin Beagin put the device through its paces to find out just how true those claims are.

46

Adding up the Plus/4: The new Commodore Plus/4 previewed

It's now official that the new Commodore Plus/4 will be making an appearance in your High Street shops, but it's not actually launched until after that move has gone to press. So we got Karl Dallas to argue a pre-launch model (albeit without the ROM-based software). He feels his opinions with some hands-on experience.

54

Adventuring for regulars:

This month's adventure columnist John Ransley initiates a regular spot for the dedicated adventurer. Reviews of games, books, hints, opinions and more.

Fred on sound: Synthesiser packages reviewed

Recovered from last month's introduction to synthesisers and the Commodore 64's SID chip, Fred returns to look at a range of synthesiser packages currently available on the market.

Screen scene for the Commodore 64:

Victuals for the 64:

Teaching yourself how to spell in French can be pretty boring. Here's a program that not only franchises your 64 (or your Vic) but also provides a way of testing your French spelling. For the non tagalog, there's a program to make your 64 beep whenever you hit a key.

Dollas on business: Micro Magpie reviewed

Audigenix's Magpie was originally a cartridge-based database program costing around £150. Now it's available on disk for a bargain £29.95, making it probably one of the cheaper databases around. Earl Dallas finds out how well the new version works.

Pet with more memory: A look at the new Commodore 8296

Encased by the 128K memory of the new Commodore 8296 Karl Dallas went out and bought one - and was ready to condemn his VIC Pet to the scrap heap. He soon found out the 128K is not all that is claimed.

Know your Rights: How to complain about duff products

So you think you know your Rights when it comes to complaining about faulty or unsatisfactory products you've bought? Commonsense tells you simply to take back any duff hardware or software. But life and the Law are never quite as simple as that. Charles Christian explains your Rights and shows you how to complain successfully.

Book Look:

Another batch of critical penurials of computer and computing books

Tommy's Tips:

Tommy continues to burn the midnight oil, answering yet another batch of queries from distraught Vic and 64 owners.

Readers write:

Commodore Corner

Readers will remember that Commodore made a big noise about the Commodore International Computer Art Challenge it organised in April. True to form, it's just announced the winners in equally grandiose style, exhibiting the winning entries at a prestigious art gallery in London's fashionable Mayfair.

The overall winning entry came from a certain Hugh Riley, a fine arts graduate from Manchester whose work bears the cryptic title "Louise (Mediation Failure 128)". The image itself is equally baffling to the intelligent. It depicts a baby's face with a fly buzzing to and fro, perching intermittently on the infant's nose - Louise, in fact, Hugh's baby son.

According to Hugh, his entry makes some statement about his current state of unemployment, a fact Commodore did not fail to mention, probably because it enhances the altruistic factor of giving him not only £1,500 of Commodore equipment but also a £5,000 endowment to enable him to study computer art at the place of his choice. "I'll probably go to America," says Hugh, completely unaffected by eager media attention.

Other winning entries were not quite so problematic; one winner in the "dynamic" category depicted the face of E.T. emanating from a black box. Another, called "Mr Freakenstein", showed the aforementioned tapping the keys of a Vic whilst grunting hideously - probably a Syntax Error.

All entries were programmed without recourse to software aids, which was not Commodore's original intention. The Contest had been timed to coincide with the launch of the Tony Hart and Roy Hama drawing packages for the 64, in the hope that entrants would use them to generate their images - neither of those packages are yet available.

More competitions

Commodore has also announced that it's to sponsor the first European heat of the International Programming Competition in collaboration with Thames Polytechnic, the aforementioned event being organised by the Association of Computing Machinery. It's actually being held at Thames Polytechnic on Saturday, 30th October. And according to Commodore's press blurb, the event is "part of its com-

Life of Riley - Art Challenge winner

mittant to backing British education."

The idea of the contest is for teams of up to four undergraduate postgraduate students to solve a set of six programming problems, using either Fortran or Pascal. Simply the team that finds the solution quickest will be declared the winner.

Commodore is providing its 6000 series computers on which the brainwashing sessions will take place. Apparently, the 8000 (or Pet) series is widely used in colleges and universities in Britain. And it looks as though Commodore is phagging that market heavily due to its lack of success in ousting the BBC macro from its lofty pedestal as the 'macro for primary schools.'

New games for old Vic

In the meantime, Commodore is vigorously quashing rumours that the ageing Vic 20 is doomed to oblivion, the official line being that Commodore will continue to produce Vics if the demand warrants it. At present, that seems to be happening. And to reinforce that commitment, Commodore continues to launch new Vic games when almost all the independent game companies have turned their Commodore-orientated attention to the more illustrious 64.

Just announced for the unexpected Vic are *Epaper Punch* and *Starbase*; the former involves knights, dungeons, dragons and treasure, whilst the latter reworks the "aliens attack futuristic planet" theme. More down to earth (well, not quite) is *Bomber Mission*, a new flight game that needs 16K expansion. Looks like there's something for all tastes, especially since prices are standard at just £4.95.

SHORTS

Wafadrive late: It now looks as though a Commodore 64 version of the Rtronics Wafadrive disk storage system, mentioned last month, will not now be appearing in September as was originally intended. According to Rtronics director, Peter Booth, "we're now going to be a little late for the Christmas market". A delayed version was produced, however, just to prove that no legs are being pulled. Rtronics plans to include a free wordprocessing package, written by Hewson Consultants, when the device actually appears. A small selection of games should also be available on wafer. Notable interested parties include Artec, Schak, Romik and Melbourne House.

SHORTS

Ground control: Flight simulators for the Commodore 64 seem to be all the rage at the present. But software house Supersoft reckons it's smarter than the rest by producing something more extraterrestrial, a space flight simulator called *Interdictor Pilot*. The package includes a 48-page manual which, according to the blurb, "provides an insight into the latest technological developments including travel at the speed of light". When you've got bored with reading, you can take part in simulated dogfights with alien craft! The cassette version costs £17.95, and £19.95 for disk - space travel was never cheap.

SHORTS

Zapping with Danger Mouse: Fans of that intrepid cartoon rodent, Danger Mouse, will be pleased to hear that Creative Sparks is launching a Commodore 64 game called Danger Mouse in Double Trouble. That will be followed by Danger Mouse in the Black Forest Ghostrace - should that have been 'gatson'? Both games will be available on cassette only, costing £7.99 each. But there is a bonus: some buyers of the Double Trouble game get to enter a competition. What do you win? How about a trip by Roller and Helicopter to the Corgoville Hall where the Danger Mouse series is filmed?

Gremlins and Presidents

The games software industry must have an unquenchable desire to provide us all with new and original games to play. The latest avenue it's exploring is politics and current affairs.

A new software house, Sheffield-based Gremlin Graphics, has been making a name for itself (notably on television programmes) by re-creating a Commodore 64 game called Wanted Money Mole, which capitalises on the (still ongoing) miners' strike.

Money, the fury little protagonist, is on a coal-snatching mission in the South Yorkshire coalfield, doing battle with Syngenta pickets and eventually confronting 'a heavy figure seated on a graphite throne'. The aforementioned is called Arthur. Money must topple Arthur from his lofty position by seizing secret ballot papers - and so it goes on.

Whether that's bad taste or not depends on which side of the picket lines you're standing. But Gremlin is trying to calm any race complaints by donating 5p for every game it sells to the Miners Welfare Fund, as well as a £250 lump sum donation to that same cause.

Meanwhile, a new range of Brain Games is being launched by Brighton-based Amphion. As the name suggests, the games are de-

Elite hologram

Credit card holders will have noted the many holograms now being printed on their favourite pieces of plastic. They may be hot to twiddle around but their real purpose is to put the dampers on would-be counterfeeters. Now, that idea is being taken up by the games software industry in its seemingly endless quest to sap the parasites.

Elite Systems, a newly formed software house, is planning to include a hologram sticker on insert cards for all its games. No games have actually appeared yet, but an Elite spokesman reckons three titles will appear in Autumn for the Commodore 64. One is curiously called Elektroline Wiff, the other two are based on American TV series. There's no escaping them.

The holographic process is expensive, but Elite says its games prices will remain competitive at around £5.99. If you lose interest in the game, you can play around with a three-dimensional Elite logo. Whether the process succeeds or not, it will certainly make the games more attractive to prospective buyers, curiously, eh?

signed to demand some brain work, as according to Amphion's Peter Wood, "the majority of games on the market don't present players with sufficient challenge to keep them coming back to replay".

Amphion reckons it takes brain power to become President of the USA, so it's produced Election Trail for the Commodore 64.

In 'one player' mode, you campaign for the Republican party against the Democrats, represented by the computer. The aim is to win as many States as you can by using various methods to gain support. Those include holding rallies, public debates, media campaigns and getting endorsements from movie stars. You also hold regular opinion polls to see how your party is getting on - pretty realistic, eh? Presidential enquiries on 0273 608331.

Speaking up for the 64

The long-awaited Speech 64 speech synthesiser cartridge from Currah Computer Components is now available. Wary of being thought too modest, Currah describes it as "the most user-friendly and versatile speech unit available for any computer, anywhere". After that lot, the £29.95 price-tag seems quite reasonable.

Speech 64 works by using a set of allophones - the sounds that go together to make up a particular word. That means the package has an unlimited vocabulary because it builds words from its stock of component sounds. Sound is actually generated through the speaker on your TV or monitor (a DIN plug from the cartridge slots into the 64's video port).

Using the Basic command SAY, the device will voice any text or numbers inside inverted commas, following its programmed set of pronunciation rules. But it does occasionally come unstuck - 'comb', for example, is pronounced with a 'b'. But you can type the word using conventional allophone notation to get the sound right.

Apart from the SAY command, there's KON, any key you hit is voiced (even the cursor and function keys); and KOFF, which turns the facility off. You have a choice of two voice pitches (gained by placing either a 0 or 1 after the SAY command), and various levels of intonation. For the more advanced, the (rather small) manual gives examples of incorporating speech into Basic and machine code programs, using the cartridge's 256 allophone buffer.

And Speech 64 looks like making an impact on the games market. Since it uses none of the 64's operating system, its facilities can be incorporated easily into games. Already, Amrog's new P.C. Fuzz game uses it. Or maybe you just want that rather tiny Dalek voice to wake you up in the morning? We'll be reviewing it soon. More details on 0439 72996.

SHORTS

Funny titbits Dept: Richard Shepherd Software is all set to launch a new adventure game for the Commodore 64, with the unimaginative title, Upper Oumtree. Without giving too much away, the game features a certain Professor Blawatzka who holds the fate of the world in his hands. Good simple fun? Late September is forecast as the launch date and the game will cost £9.95 on tape and £12.95 on disk.

SHORTS

 171 FOR I = 1 TO 5000
 172 K = (K+(K'R)) - P.
 K - P THEN M = I : I =
 5000
 173 NEXT

A COMPLETE COLOUR MICRO WITH NO HIDDEN EXTRAS FOR AROUND £499.

The title of 'genius' is not bestowed lightly on man or machine, those extraordinary qualities and powers of intellect are rare.

Einstein had them in full measure. And so now does the new micro computer from Tatung, designed and built in Britain and appropriately named - Einstein.

Einstein was created by Tatung, one of the world's leading electronic companies, and given the capacity and the remarkable

capabilities to compete with computers costing far more. Its simplicity of operation will appeal to the first time buyer and to businessmen who don't want to lose staff to expensive and time-consuming training courses. At the same time its operating system is both powerful and sophisticated to satisfy the most advanced requirements.

For those who have outgrown their existing primitive machine, the speed and capacity of the 500K built-in disc drive will make all the difference. And for the small business man, the ability to store and retrieve all information in seconds will be as important as Einstein's built-in flexibility, which allows the system to grow as the business develops.

BUILT-IN 80K MEMORY

Total memory capacity 80K RAM divided into 64K 'user' memory and 16K for colour graphics production.

BUILT-IN DISC DRIVE
500K 3" compact floppy disc drive. Potential for massive extra storage with a second 500K disc drive internally.

BUILT-IN 16 COLOUR GRAPHICS High resolution graphic animation from 32 sprites (definable shapes), 16 vivid colours.

Einstein

BUILT-IN EXPANSION PORTS

Connection to both TV and optional colour monitor, most printers and other computers via RS232C interface. Also twin joystick ports, 8 bit user port, exclusive Tatung Pipe.

BUILT-IN FLEXIBILITY

Powerful Crystal BASIC. Multi-lingual plus ability to run CP/M +

BUILT-IN VERSATILE SOUND

Sound synthesiser facility includes chromatic music with three voices. Substantial speaker with volume control. Provision for speech synthesiser.

Einstein has them all. Feature for feature, it meets the needs of the novice and the experienced operator, both at home and in the office.

Einstein, designed and built in Britain, is a complete colour micro computer with no hidden extras.

And for under £500 is sheer genius.

Extending the Legend

Legend's Valhalla soared up the Commodore games charts when it finally appeared on the 64 a few months ago, finally because it had achieved cult status long ago on the Spectrum. Whether that was a mistake or a clever marketing ploy, Legend has changed tack; it's re-releasing The Great Space Race, its latest offering simultaneously for Spectrum and 64.

The game is due to appear in early October (no price yet) probably heralded by a massive spend

ing spree on publicity. The game itself is rumoured to have cost £200,000 to develop. With that kind of money involved, you don't keep a low profile.

According to Legend director, John Peel, the new game uses a new operating system called Movsoft 2 which "features technical effects never seen before in home computer software." And the graphics? "We have finally achieved true solid 3-D graphics, which, under the control of a computerised 'camera director' create the most realistic and spectacular pictures ever." Modestly apart, the game looks set to bring in more money bags for Legend. We've queuing up for our review copy.

Cassette player convertible

Commodore users have grounds for being disillusioned with their lot when it comes to using Commodore's own Datasette for loading and storing programs. Priced at around £40, the device is somewhat expensive, there are no real alternatives to it, and having paid your money, you can do nothing else with it. Enter the DR2301 data recorder for the Vic and 64 from Electronics, which doubles as an ordinary cassette recorder, and comes just £24.95.

Electronics supplies a cord which you plug into the DIN socket on the side of the device, and then end into the cassette port on your Vic or

64. The unit then takes its power from the computer and works just like the Datasette. Two differences, though: there's no recording light, and if you turn the volume up you can hear the data loading signals - those amount to a load of nasty screeching sounds.

Our review model happily loaded even the largest 64 games programs and had no trouble with the new fast-loading systems now being introduced on games.

As a tape player and recorder, the DR2301 performs adequately. Nothing brilliant in the way of sound (there's a volume but no tone control), but what can you expect for the money? By the way, you can't play audiotapes when the device is plugged into your computer. That's a pity; music while you program might have been an attractive proposition.

The 64's built-in cartridge ports - these are the two little rectangular holes at the bottom of the console - are the best way to connect your computer to the outside world. They're the price: £24.95. DATA recorder is as easy as the Datasette, though, so you can use it to store your programs on tape. DR2301 (not recording player) just one of the improvements on the DR2300, one of which was a much better budget alternative. The DR2301 is a bit more expensive, but it's a better product. You won't need to buy it for the 64, though, as the DR2301 will fit into the Spectrum's cartridge port.

Consider our software from a professional point of view.

If you ever have to bring work home from the office you can now tackle it professionally thanks to Practicorp's range of advanced programs for the Commodore 64.

PRACTICALC 64.

Working on budgets, sales forecasts or cash flow at home has never been easier. With the Practicorp 64 spreadsheet and your Commodore 64 you have a totally professional system. It has 2000 cells, more than 20 mathematical functions, the ability to insert or delete rows and columns, sort information alpha-numerically and seek specific information. And you won't need a cash flow projection to see if you can afford it at only £44.50 (disc) or £39.95 (tape).

PRACTIFILE 64.

If you need access to files, client or patient information, names and addresses then Practicorp 64 is your instant answer.

Practicorp is able to handle 5800 record entries, sort them, file them, retrieve them. It can calculate within individual files and prepare your own style of reports. And what's more its easy menu-driven program makes it child's play to operate. Only £44.50 for the disc version.

INVENTORY 64.

For keeping track of stock, Inventory 64 is just the job. It'll tell you how much stock you have, where it is located, how much it's worth, what you should re-order, and from whom. With a capacity of 650 items, Inventory 64 is ideal for the average small business, and excellent value at only £29.95 (disc).

Practicorp's software is available at all good computer stores, including selected branches of

Boots, W.H. Smith and Menzies.

Forth

The Forth Dimension: Programming with a DIY Language

Part two – Peek-a-byte

by Richard G Hunt

The Forth dictionary consists of up to 200 or so words. So far I have mentioned only a few of the arithmetical words and to cover every word is outside the planned scope of these articles, the object of which is more to initiate conversations between the reader and the Forth system in your computer. In so doing I hope you'll see that Forth can be regarded as a computer environment where DIY reigns supreme.

The 6502 processor family has the curious habit of presenting any two-byte address (please take care not to confuse a machine-code 'word' of two bytes - which in Forth is a 'cell' with the word) in low byte, high byte order. This is why in Basic one must PEEK(43) + 256 * PEEK(44) on a Vic to find out the decimal start of Basic RAM.

The actual sum might look like $1 + 256 \times 18 = 4609$. In Forth the operation would be ~ 1 18 256 + (RETURN) 4609 OK.

Supposing we wanted a Forth word to perform the correct operation on any pair of addresses. Obviously other addresses must be used. Forth certainly does not use the Basic memory pointers! The word (civ.) is known as 'tee-fight', it copies on to the stack the contents of the byte addressed thus - 641 cfa 642 cmn <

Now the operation $> 256 + ~$ can be performed. To create a new word the colon definition should be used. Let's define the word (LOWHI) -

: LOWHI swap cmn rot cmn swap drop 256 + ~ drop ;

Now what's all this 'swap drop' business? (swap) merely exchanges the places on the stack of the top two items. (rot) rotates the third stack item to the top of the stack (TOS), and (drop) drops the TOS right off the stack. They are needed here because we are asking (LOWHI) to operate on two addresses we supply, for example ~ 641 642 LOWHI <. In order that the correct multiplication and addition take place the operands must be correctly positioned.

In our example the stack now looks like this

```
1) 641 642
2) 642 641    swap
3) 642 641 0  cmn
4) 641 0 642    rot
5) 641 0 642 18  cmn
6) 641 0 18 642 swap
7) 641 0 15 256 drop 256
8) 641 0 4608    ~
9) 641 4608    -
10) 641           -
11)                 drop
```

The effect of words on the stack are shown by stack diagrams. Thus for (LOWHI) would be (addr1 i addr2 ~) where two supplied

addresses cause the word to function

A problem ensues if the result of the word is greater than 32767. This is the largest signed number Forth can handle. In this case we are not interested in the sign of the number, so we can substitute (U) for (~). Now our input is requested as an unsigned number, any number between 0 and 65535.

Actually I don't think (LOWHI) is particularly useful except as a demonstration. You may

FORGET LOWHI< as choice.

Now for an objective that extends the idea of looking at memory. Let's define a word that ideally gives a hex memory dump on the screen with ASCII equivalents. First define a word (PEEK)

```
: PEEK CMN U. ;
```

This is recognisably a derivative of (LOWHI) but uses only one address as a parameter.

Next we diverge while I introduce the first Forth structure word (DO LOOP). This enables repetitive processing for a definite number of times (OO) requires two parameters, a limit

and an index. The limit represents the highest increment of the loop. The index is the start. Words between (DO) and (LOOP) are thus executed (limit index) times. For example, the word

```
: TEST 10 0 do 2 3 + loop ;
      will output
```

5 5 5 5 5 5 5 5 5 5 5 5 OK

The index that increments with each loop can be used to increment the address you wish to (PEEK). The index word (I) is used in a loop like this

```
: TEST2 10 0 do I loop ;
      . which outputs
```

0 1 2 3 4 5 6 7 8 9 OK

Now we can build a loop into our new word

```
: DUMP 1+ swap do I peek or
loop ; (addr1 addr2 --b)
```

This takes two memory addresses, adds 1 to the second, swaps their order and uses them as parameters for a loop that PEEKs the value of the byte accessed by the loop index. Try it.

Forth

Now >FORGET PEEK< and redefine it so -
PEEK swap do i n m :loop :
 This has another effect. (n) fetches a 16-bit value - two bytes at a time, as opposed to (m) which fetches only one. What need was there ever for (LOWHI)?! Can you think of a way to display the address against its contents? Answer at the end of this article...

You can in fact play around with versions of (PEEK) and (DUMP) which allow you to display whatever you will. It's a good way to find out what is happening in the Forth system that's different from the Basic you already know.

Some implementations may already support (DUMP) in the form I stated earlier as my objective. Here, with comments (which may be omitted when you enter it), is my own DIY version based on that objective: it uses some words I have not explained yet. Note the re-definition (purpose-built) of (PEEK) and how it and (ASCII) are built into

```

: PEEK do i n m :loop i 1 reads, format & display byte from stack
: ASCII do i n m :loop i 1 read & display each character
: DUMP hex i 1 set base 16i
: 14 swap cr i set outer loop parameter to 16
: n i begin :loop
:   i dup dup i swap 3 copies of index
:   i 4 rot rot i add loop increment and order them
:   i swap ror i create unsigned double number and hex2int
:   over over i swap inter 1600 characters
:   over space
:   16 i 1 cr
:   6 16loop i increment over and swap
: decimal2 hex2int base 16r
: i

```

the higher level of definition. The whole code should be entered on an editing screen and (LOAD)ed.
 (x.) & (d.x.) are formed
 number output words (dup)
 copies the TOS while (over)

copies the second on the stack to TOS. (space) outputs an ASCII blank, and (+loop) increments the loop by a specific quantity, like BASIC STEP. The loop increment may be changed to 8 for a C-64.

Next time - all about the stack.

Answer to the problem set above:
i PEEK i + swap do i i :loop :

commodore FASTBACK IS HERE

A TYPICAL COMMODORE 64 OWNER WAITING FOR A PROGRAM TO LOAD FROM TAPE... BUT NOT ANY MORE!

THE AMAZING NEW PROGRAM FOR THE 64

Gives unlimited vocabulary and can be incorporated into your own programs using "SPEAK" as a basic command.

ONLY £7.95 NOW YOUR TALKING!

-TAPE TO DISK TRANSFER UTILITIES-

Transfer games etc. to disk. Supplied on tape with full instructions for -

BBC

ATARI (All models)

£9.95

HUGE RANGE OF SOFTWARE & BOOKS FOR BBC ELECTRON, SPECTRUM, COMMODORE 64, VIC 20, Oric, Dragon, Amstrad & Zx81.

Trade and Overseas Orders welcome.
 All prices include Postage, P.D. & Bank Draft
 or phone our Card Reader to 0386 49641

At last a utility that provides fast-loading. FASTBACK allows multi-part software to load around 10 TIMES FASTER and run independently of the utility. For example: load "The Hobbit" in 150 seconds with FASTBACK.

Supplied on tape with full instructions

ONLY £9.95

AHO FOR DISCO USERS

Our latest and most sophisticated Tape to-Disk utility is so easy even a child can use it. DISCO creates its own buffer steps to ease the job of transfer. All programs auto run once transferred. We guarantee this is the best Tape to Disk you can buy.

Supplied on tape with full instructions

ONLY £9.95

DATA RECORDER

From the same factory as the C64 - the Super Saver 20/64 Data Recorder (no interface required)

This is your pilot speaking...

Flight Simulators for the 64

by Jim Grubbs

There is a picture that hangs in my house of a young lad about 10 years old or so. The setting appears to be a clear summer night: the boy's sights are focused on the sky as a large aircraft passes overhead. My grandmother says that it reminds her very much of my father at that age - Dad went to join the air force.

The family interest in what we now call aerospace continues with me. And with a Commodore 64 computer, you can do the next best thing to actually piloting an aircraft - complete with good sound, vision and colour effects.

Several flight simulator packages are available. Here's the results of many hours of test flying some of the best. Chris Durham has added a piece on Anirog's 737 simulator.

Solo Flight by Microprose

Solo Flight was written by Sid Meier for the Atari and adapted to the 64 by Grant Irani for Microprose Software.

One of the attractions of this package is the ability to choose from several different locales to fly in - the flat country of Kansas, the mountains of Colorado, and

practise landings continually. That's the most difficult part of flying and *Solo Flight* allows you to get on top of it.

The response of *Solo Flight* to changes in joystick direction is excellent. Controls operate smoothly. It is a delight to fly this one.

At \$34.95 US, £14.95 (on both cassettes and disk) in Britain,

the unique combination of ocean on one side and mountains on the other of coastal Washington State offer something for everyone.

Once you become an ace you can try the mad run game that is included and put your skills to a real trial. And you can also exercise some control over the degree of difficulty by varying the weather conditions and such.

The bottom portion of the screen displays an instrument cluster not unlike those found in the cockpit of a small aircraft. The upper part of the screen is a three-dimensional view, though the view projected is somewhat different than a true "view out of the window"; it's more as if you were being followed by a television crew in a plane behind you. That's the perspective you have.

This detracts slightly from the realism of the program. But the view is fairly detailed. When you

are close to the ground, you can even see your shadow. The scenery remains in perspective as you bank and turn.

A 16-page instruction booklet is included that adequately describes the basic techniques of flying and includes maps of the airports.

In addition to flying visually, *Solo Flight* is equipped with avionics for IFR (instrument flight rules) operation. When flying IFR, the top of the screen turns

totally gray so you must navigate by instruments alone.

The instrument landing system (ILS) included is not quite as realistic as some tested, but does give you a feel for instrument-assisted flying.

After an IFR flight, a map is projected on the screen showing the actual course you flew. That can be quite interesting, particularly when you first try it!

One of the features I found most welcome is the ability to

Solo Flight is definitely good value - sure to bring you many hours of enjoyment.

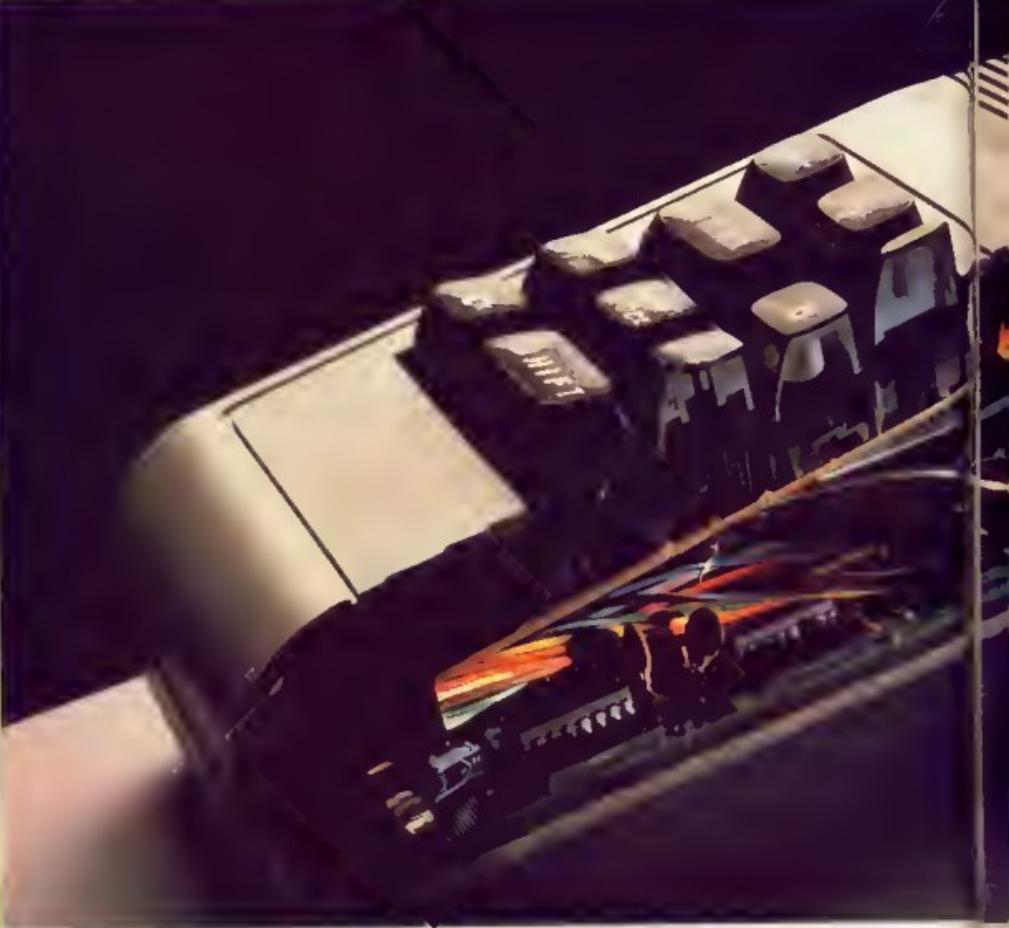

IFR by Academy Software

Academy Software invites you to put on the "hood" and fly its *IFR* simulator. Written by Ron Weantaja, a private pilot and employee of Boeing Aerospace, *IFR* is an excellent package if you are interested in instrument flying only.

Since you have no view out of the window at all, the instrument panel of *IFR* takes up the whole screen.

You begin by selecting the degree of difficulty and the amount of turbulence. An editor is also available for changing other flight conditions; a 20-page instruction manual comes with the package.

Two ILS airports are included and two co-instrument approach runways are also available.

Are you only using

To only play games on a Commodore computer is like asking Albert Einstein to work out the square root of four.

The computer's brain barely ticks over.

To really stretch it, you need more interesting software programs. For example, record keeping, interactive education, stimulating adventure games or word processing.

And for those you need peripherals.

Like a Commodore disk drive, a really fast storage and retrieval system with a vast memory.

Or a Commodore cassette unit, the inexpensive way of loading and storing programs.

For those who like the idea of text and graphics being more alive and having greater clarity than on a TV, there's the Commodore colour monitor.

Is it using $\frac{1}{10}$ th of your brain?

And for hard copy, there are our four printers and a printer plotter. These will preserve on paper—in colour, black and white, chart form, graphs or text, the fruits of all your labour.

Finally, for more exciting games, there are joysticks and paddles.

So use your brain. And make sure you use all of your computer's brain.

COMMODORE MPS801
Dot matrix printer £230.00
Tractor feed. Print speed
50 characters per second.

COMMODORE MPS802
Dot matrix printer £245.00
Friction feed for standard
paper. Print speed
60 characters per second.

COMMODORE MCS801
Dot matrix colour printer
£369.99. 7 colours including
black. Print speed
36 characters per second.

AT LAST ... SUPERIOR SOFTWARE FOR THE COMMODORE 64 COMPUTER

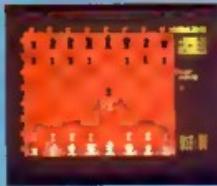

COMMODORE
64

PERCY PENGUIN £7.95

Many of our titles are available in Boots, W.H. Smiths, John Menzies, Bumblelows, Losleys, Currys, HMV, Greens at Debenhams and Spectrum Shops. Also at all major computer dealers - Ebsco Computers, Micro Management, West Coast Personal Computers, Microstyle, Electronique, 3D Computers, Computerama, GTM Computers, etc. Our software is also available through all the major distributors, and directly from us by mail-order.

CHESS
£7.95

Chess and Draughts are written by the author of our successful BBC and Regal Editions Chess programs. This program is a highly versatile implementation of the game. Play black or white against the computer or a human opponent. The skill level of the computer can be varied (initially and midway) according to the player's coordination or success. Moves cannot taken back if an error has been made, and the board can be modified at any time. Games can be "saved" or "loaded" and the last game can be replayed. The editor can, if requested, suggest your moves.

- (1) All our software is trackable before we advertise.
- (2) All our software is despatched within 48 hours by 1st class post.
- (3) In the unlikely event that any of our software fails to load, return your cassette to us and we will immediately send a replacement.

Review

Since this is strictly an IFR simulator, you may be asking, how do you land IFR at a non-ILS airport? The maps in the instruction manual provide you with the exact location of the airstrip, giving the latitude and longitude for the top and bottom and each end of the runway. Landing in this fashion is quite a challenge since you have no visual cues at all as to what is going on!

You must be sure and use the map in the instructions, or you may find yourself flying along just fine... only to find out that you are too low and come crashing into a cliff.

One of the most impressive features of IFR is difficult to describe in words because it involves the sound effects associated with the outer, middle and inner markers of the landing system. Anyone familiar with avionics (aviation electronics) will appreciate the realism of the ILS implemented in IFR.

Once again, the controls respond quite smoothly. For an IFR-only simulator, this one is another winner at \$29.95 US (we don't know of a UK source - Ed)

Flight by Anger

Let you think that the tanks have completely taken over the simulator market, Anger Productions offers Flight by C. Johnson.

At a top speed of 400 knots and the sound of a roaring jet engine, Flight is definitely in the large aircraft category. It allows you to fly by themselves eight English airports.

You navigate using a grid system that takes a bit of getting used to. But the major problem is that Flight comes with no instruction manual, only an instruction card. Complete instructions are available when you start the program, including a map showing the grid system. But it's almost necessary to copy that map onto paper; otherwise you will find it very difficult to navigate properly.

In the middle of the screen is an area where instructions appear. This simplifies your pilot duties. I'm not sure that it's very realistic however.

A window view is included. While sitting on the ground you can see the runway, but once

you're airborne the graphics subdivide to a green field for the ground and blue for the sky.

Operation of Flight is very smooth, and the instructions make it easy to navigate. This program reminds me of early versions of Runway 84 (that program is not included here since I wasn't able to obtain the current version). Early versions of Runway were written entirely in Basic and responded very slowly. Flight does not suffer those problems, but looks somewhat similar graphically.

I'm sure that the local availability of Flight will make it a popular item in Britain at £9.95, but it does lack the realism and complexity of some other offerings.

For an alternative (and rather harsher) judgement, Chris Durham comments "this was one of the first flight simulators to be released for the 64, as such it had a good chance to capture a large share of the potential pilots who owned a 64. Unfortunately, potential is about all it does have since it bears about as much resemblance to flying a plane as driving a computer."

The graphic representation of Britain is excellent and a small dot shows where you are and moves as you watch, however, there's the only movement you're likely to see in the whole program because the view through the cockpit window is non-existent. The instructions are also rather poor; some of the instruments are not even mentioned!

There also appear to be a couple of small 'bugs' in the program. Try as I might I cannot get the undercarriage to stay up; it goes up and down like a yo-yo seemingly at random (or rather every time I put it up it comes down of its own accord after a few seconds!). The second problem may just be me, but every time I try to land I get an 'Emergency Climb Alarm'. This appears to lock the controls so I can't do anything about it anyway. No matter how accurately I follow the landing instructions it gets me every time.

After two months I still haven't landed, and there's lies another problem. There is no 'skill' level to alter. There are eight different airports to fly to, but if you choose one of the further ones you'll die of boredom before you ever get there.

All in all I was rather disappointed in this offering, there are now better simulators on the market at lower prices."

Flight Simulator II by Sublogic

About 150 Kilometers east of my home is the University of Illinois at Champaign Urbana. A lot of really neat things have come from the U of I - including Sublogic Corporation and an amazing item called Flight Simulator II.

Sublogic's first simulator was written in 1977 for a 108 Apple computer. FS II is a much upgraded version of the original, including full colour and breathtaking three-dimensional graphics - it's very difficult to describe FS II in a few words and even more difficult to do justice to the beautiful graphics.

The first thing that catches your attention is the packaging. FS II comes complete with a pilot's operating handbook and a flight manual, and a book on flight physics and aircraft control that includes a basic flight course! Nearly 200 pages of documentation, in two books, including realistic reproductions

© MicroProse Software

Review

of flight maps to support the 80 (!) airports programmed into the package.

When you boot the program, you find yourself sitting at the end of the runway at Meigs Field on the shore of Lake Michigan in downtown Chicago. Ahead are the twin towers of the Hancock building. As you take off, you may select from one of nine views or use your radar, zooming in or out to suit your needs.

You can see the Sears Tower and other Chicago landmarks. A very powerful editor allows you control over forty different flight parameters - you can set the levels for not one but two layers of clouds, for instance.

I decided that it was appropriate to turn my plane south and head toward Willard Field in Champaign on my test flight. As I did, Interstate 57 appeared off to my left, south of Kankakee, the checkerboard pattern of Illinois corn fields appeared.

Land marks are quite detailed, but only available in the vicinity of the airfields. After all, a 170K disk can only hold so much!

A communications radio, two navigational radios a transponder, and an emergency locator transmitter are included. So operation is quite realistic: you must tune the receivers to the proper frequency yourself.

When you enter the range of the control tower a message will appear on the top of the screen, provided of course you have your radio properly set!

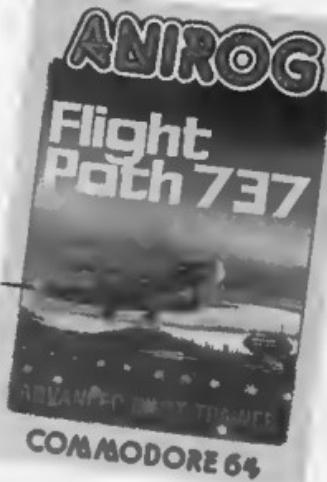

FS II allows you to select day, night, or dusk flight, and when you become tired of flying normally, a World War I flight game is included too!

Is FS II the perfect flight simulator? I think it's as close as I've seen. The only drawback I found was the feel of the controls. They didn't seem to be slow exactly, but they did seem to be dampened, like the needle on a meter. Incidentally, you can select either keyboard control, or joystick control, or a combination of the two. You may even use two joysticks if you have them.

At \$49.95 US and £41 (disk only) in the UK Flight Simulator II is in the Cadillac price range. Without a doubt, FS II includes Cadillac type features. I fell in love with it!

Flight Path 737 by Anirag

This £7.95 flight simulator is now available on tape (with TURBO load) or disk, ensuring little time is wasted getting started. It also runs on Vic (with 16K expansion) or the 64. Initial impressions are good,

the opening music is excellent and you get to select the skill level from 'Fire Solo' to 'Test Pilot'.

You start the actual simulation

looking at a fairly realistic cockpit display with the runway somewhere in front of you. I say 'somewhere' because the first thing you have to do is line up the aircraft on the correct heading before you can take off. Thus we fly to begin with, but gets rather monotonous when you have to go through the routine every single time.

Having taken off you must climb rapidly in order to clear the mountains which suddenly loom ahead - not forgetting of course to raise the flaps and undercarriage! Unlike the Anger Products effort, you can see the mountains through the windscreens (even if they are static!) and sometimes while crossing the mountain range you have to change course for the destination afield.

You then start your descent, and the simulation here is quite good, ten miles out you get a high-on-line/low-indicator plus a visual impression of the runway in the distance. There is a lot to think about since your speed increases as you descend, the undercarriage has to be lowered while still above 300ft and you can't lower the flaps if you're going over 300 knots. Having done everything correctly you touch down with a whisper (or in my case a heavy thud) and get a message telling you how good, or bad, your landing was.

Obviously you are going to make mistakes the first few times and these are all trapped; unfortunately all you get is a text message on a blank screen telling you what you did wrong, and then you have to start all over again from the beginning - even if it was just that you forgot to lower the undercarriage above 300ft. What's wrong with an undercarriage alarm? Why not let the plane actually crash? As it is, the easy option of stopping the program the minute you make any mistake, however minor, can get very frustrating.

Nevertheless, I kept having to have one more try to see if I could get it right this time; and such addiction is what makes a good game.

Unlike some flight simulators I have seen on the Spectrum, this is still not real flying, you only have one place to go to and you can't do anything fancy while you are in the air. It is however a step in the right direction.

As long as you aren't intending to go for a private pilot's licence, this simulator will keep you amused for some hours.

**Commodore 64
Edition
November Release**

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office.

Perhaps you have always promised yourself that you would teach yourself programming, but have been put off by manuals which seem to assume a lifetime spent studying computer science and mathematics. Maybe you have looked at other computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance to real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' tutorials from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Cohn and perfected

by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Method' has been translated into 8 languages and used by over 300,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk! In a matter of hours you will be writing your first programs.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, at school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W.H.Smiths, Boots, Laskys, Greens, John Menzies and better computer shops nationwide.)

Programming

User-friendly design: Six Rules for better programs

Part One of a series

by Chris Preston

This is the first article in a new series intended to help you write better programs. And when we say 'better', we don't mean Faster, or Smaller, or Containing Lots of Complicated Things that Nobody Else Understands and Neither Will I in Six Month's Time. No, this time around we want a 'good' program to be one which is a joy to use, whether you have just picked it up from the dealer or have been using it for two years.

A typical program has three sections. The first is a short initial set-up section which carries out various things which are done once and once only - such as defining arrays and setting initial values of variables. The second part is the data entry section where the user is expected to give the program all the information it requires. After this the program passes into the third section, processing; there all the real work is carried out.

At the end of processing the program may finish. Or it may go back for some more data entry as in an invoicing program, where once the details of a customer's order (the data entry) has been keyed in with an invoice produced and the value of the purchase sent to the customer's file (that's the processing), the program returns to data entry for the next invoice.

As far as the user is concerned it is section 2, the data entry part, which decides whether the program is 'good' or not. He or she does not care how polished and efficient the processing section is, or what clever tricks the programmer gets up to, the user just wants to be able to enter the data quickly and easily, without having to sit with the manual on one's knee to work out which button to push next.

The trouble is that far too many programmers see the program simply in terms of the processing section.

To them data entry is an annoy ing prelude to the delights to come. A typical programmer is like a child gobbling down dinner as fast as possible so that it can get started on the chocolate gateau.

Add to that the fact that writing a good data entry section involves

an awful lot of hard work. The net result? This all-important aspect of programming gets skipped entirely.

Remember this maxim always try to make the user's life as easy as possible. You may think a particular program or yours is easy to use, but then you would you wrote it! Your user may not be as good a typist as you and not able to find the X key immediately. He or she may be short-sighted and unable to distinguish easily all the text you have crammed on to the screen. The computer may be sited under a bright fluorescent light to confuse things.

Above all, what seems obvious to you may be an impenetrable wall of incomprehension to the user.

Before looking at the requirements for a good data entry routine, there are a few requirements for screen display which are often overlooked.

1 Every screen should have a title telling the user exactly what he or she is doing.

TELLING
THE USER

If the user selects an option to modify a file, the program should put a banner at the top of the screen saying "FILE UPDATE" - preferably with the name of the file too, as in "ADDRESS FILE UPDATE". That way if he gets distracted by a phone call, he can come back to the machine and tell at a glance what he was doing. Don't forget that a new user may be unable to find this out from the screen display without a bit of head scratching - and when users have to think, they make mistakes.

2 Choose suitable colours for the display.

Scientific tests have clearly shown that, for prolonged use, the best (which in this case translates as least strenuous) video display is probably green or amber text on a black background, black and white is no good at all! Some computers do not give any choice, but even those with a monochrome display usually give the programmer the choice of light-on-dark text or dark-on-light text.

If you have light text on a dark ground, when the user is poorly focused the light writing will

SURFACE COLOURS

spread out without a drastic effect on legibility. On the other hand, you use dark text the bright background will spill into the letters making it impossible to read clearly. This is especially important if an ordinary TV is being used rather than a monitor, because a TV cannot produce the same quality of picture.

In addition, though, Vic and 80 users have the benefit of being able to show many colours on the screen. Use them by all means - you'd be daft not to! take the opportunity to make the display more meaningful and more immediately comprehensible. But be careful. Unless you are an artist or an interior designer and know all the pitfalls of putting clashing colours together, you can easily produce a technicolour nightmare which could quickly produce a technicolour yawn in a user!

3 Error messages should always appear in the same place on the screen.

The best place for this is probably the bottom line of the screen. Putting the text in the same place all the time means that the user does

not have to search the screen for the error message.

In addition, the error text should be made to stand out from the screen by using reverse video or some contrasting colours. We can get away with dark-on-light here, because the message only has to be read once before (hopefully) it is removed from the screen, that is not too much of a strain on the reader.

DON'T GO OVERBOARDED

Of course where possible an error message should always be accompanied by a noise from the computer to draw the operator's attention. Suitable noises are easy to generate in the Vic and 64 (but again, please don't go overboard on these); most Pets will respond to PRINT CHR\$(7) with a pretty little warble from an internal speaker.

4 REMOVE PROMPTS FROM THE SCREEN ONCE THEY'VE BEEN SHOWN.

If you display a prompt on the screen saying something like PRESS ANY KEY TO CONTINUE, perhaps while waiting for the user to put a new disk or tape in a drive, it should disappear once a key has been pressed.

That is easy enough to do by overprinting it with a string of spaces:

```
100 PRINT "LOAD A BLANK  
TAPE IN THE CASSETTE  
DECK"  
110 PRINT "AND PRESS ANY  
KEY TO CONTINUE"  
120 GET AS  
130 PRINT "[CUP][CUTP];  
SPS:PRINT SPS
```

The string SPS is just a string full of spaces. (It saves a lot of space to say PRINT SPS every time you want to print 40 spaces rather than a PRINT command followed by quotes and 40 tape on the space bar.)

You can also print a smaller number of spaces (for blanking part of a line) by using LEFT\$(SPS,15). As well as using less memory (only nine bytes), it is also obvious when listing the program exactly how many spaces are going to be printed - it is quite difficult to count spaces in a listing. Writing programs is quite enough work without making it unnecessarily hard on yourself!

Again prompts can be made to stand out from the screen by using contrasting display modes or colours.

IT SHOULD DISAPPEAR...

FIT THE USER...

5 MAKE YOUR TEXT FIT YOUR USER.

Different people wear different-sized clothes. Twiggly would not feel comfortable in one of Cyril Smith's suits (especially if he was still wearing it). If possible, then, tailor your text to your user. If the operator is an experienced computer user, you can be far more brief in your instructions ("MOUNT A BLANK CASSETTE") than you can if they have never seen one before ("PUT A BLANK CASSETTE INTO THE DRIVE, CLOSE THE DOOR, AND PRESS THE PLAY BUTTON").

More often than not, of course, the programs will be used by a range of people of varying experience. The important thing here (and it is very difficult to achieve) is to write an all-purpose program - one that is sufficiently self-explanatory to be easily controlled by a first-time user, but one which a regular user does not find needlessly repetitive.

A good example of how you might manage this is the WordStar word processing package. It has three 'levels' of user instructions, from one with no prompts at all to one where almost every key depression produces another menu of options which can be selected. The user picks the one he or she is happiest with. In addition it is possible to ask for 'help' on any topic relating to the use of the program, in which case text is displayed on the screen explaining the point in detail. (The subject of menus and 'help' screens will be covered in a later article in this series.)

6 USE CAPITALS.

The point here is that CAPITAL LETTERS are twice the size of lower case ones; remember that short-sighted old codger with a clapped-out video display and bright light overhead. While a may look very pretty mixing upper and lower case letters, remember that a program should be useful as well as nice to look at.

The only possible exception is the Vic-20, because the letters are so big anyway but 40 or 80 column screens should usually be left in upper case.

SHORT-SIGHTED OLD CODGER

Next issue: down to the nitty-gritty with data entry - how to do it (and how not to do it).

Project

Control your home with your Vic or 64

by Chris Durham

Part Two of the series

This month we continue our series on how to control your home with a few ways of getting more out of the User Port by adding another part of our system.

Last month we showed you how a simple interface unit could control up to eight mains-powered devices. This month we are going to go one stage further and give control over the same eight devices - but using only half the number of lines from the User Port.

And for those who like the ideas mentioned last month, but don't want to build, we look at some of the commercial units currently available.

First, a quick overview of how the User Port works. The User Port is located at address 55577 in the 64 memory map, 37136 in the Vic memory, and it can be PEEKed and POKEd like any other location.

Those of you who have not played around with the User Port may be wondering how the Port knows whether it is being used for input or output. This aspect is controlled by a register (or address) within the computer called **Data Direction Register** which is located at memory address 36519 on the 14, 37138 on the Vic.

There is a direct relationship between this register and the User Port; each of the eight 'bits' in the register determines whether the corresponding line in the User Port will be an input or an output. If the 'bit' is set to a 1, the line is an output and if it's 0, the line is an input.

So setting the Data Direction Register to the value 15 will set up the first four lines of the Port as outputs and the remaining four lines as inputs (Figure 1). Once this has been done it is then merely a matter of POKEing a

value into the User Port address to set the lines on or off. To get an input requires a PEEK command to read the value of the input lines.

Logical digression

In order to use the facilities of the User Port to the full it is necessary to understand how the operators **AND** and **OR** work.

Together, these allow you to set or unset individual 'bits' in an address without affecting the rest of the address. Each 'bit' in an address has a value equal to 2^n where n is the bit number (see Figure 2).

If we **OR** an address with a number, the final result sets to 1 all the bits which were 'on' in the address to start with plus those bits which make up the offset number (see Figure 3). With the **AND** function, the result is to leave set only those bits which are common to both the address and the number (Figure 4).

If you look at the code we used last month to turn the individual lines on and off you should now be able to understand how it works. But you

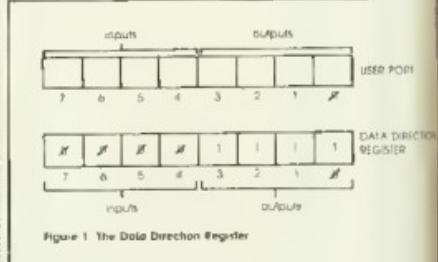

Figure 1. The Data Direction Register

may wonder why we set the line to 0 to turn a device on and 1 to turn it off, surely that's the wrong way round?

In fact the interface we built last month is designed to work on 'negative logic'. Without going into too much detail, this is done to make the circuit more efficient and fail-safe, if the line is broken or any wires touch each other the main device switches itself off.

The Control Interface

This is the circuit that is going to do the decoding for us and thus to allow more efficient use to be made of the User Port. It is based on a device which will decode four bits into their 16 possible combinations.

If we connect this widget across the first four lines of the Port, then by POKEing any

number between 0 and 15 we can set the relevant output on the device.

That isn't all we have to do, though; the device can only have one of its outputs on at any one time. This means that we switch another device on, the first device promptly switches off again. What we need is some form of storage so that we alter one device at a time without affecting any others; a storage device that does this is called a latch.

Diagram 1 shows the block diagram of the circuit we will be using. Each of the two latches takes eight lines from the decoder: four to switch the latched outputs on and four to switch them off. A total of eight controlled lines are then converted to negative logic by the final buffer driver.

This last serves two purposes, in addition to inverting the logic state, it provides the necessary power to drive the mains controller.

In order to conserve the limited power available from the computer I have used CMOS (Complementary Metal Oxide Semiconductor) devices throughout. Unfortunately, CMOS has an extremely limited power output and cannot provide sufficient current to operate the opto-isolators over a long length of cable.

The final bit of the circuit is therefore a special High-power CMOS (HCMLOS) device - with all the characteristics of a CMOS device, but with power output levels equivalent to the higher power TTL (Transistor/Transistor Logic) devices. This is a new breed of integrated circuit and

may not be readily available from normal suppliers. If you do have difficulty your supplier should be able to obtain it from the address given in the parts list.

Construction details

This unit requires a custom-made PCB, the layout of which is shown in **Diagram 2**. The component layout is shown in **Diagram 3**.

For this board the construction is very straightforward. First solder the wire links, connecting plugs and DIL sockets; then do the discrete components. Next, solder the two wires for the reset switch (if fitted); and then solder the first eight wires of the ribbon cable (the remaining wires will be used for the input board in the fourth part of the series). Leave at least 1in space on the unused wires.

Finally, clean up the copper tracks with meatis, getting off all the excess flux; check that there are no solder bridges and that all components are correctly mounted.

Once you have done that you can solder the ribbon cable to the User Port plug as shown in **Diagram 5**.

The last stage is fitting the ICs into the socket. Because we are using CMOS devices it is important that you handle them with reasonable care, they are particularly sensitive to static electricity, and careless handling can damage them irreparably. The best way is to earth yourself to a water pipe (or similar) before touching the ICs. Put them carefully into the sockets, taking care not to bend any of the pins.

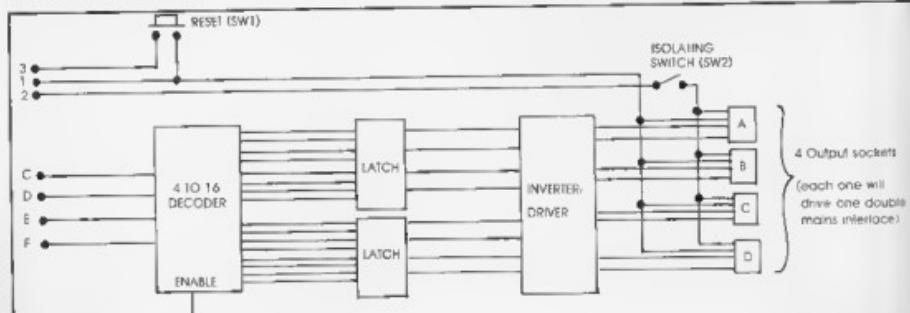

Diagram 1: The Control Interface Circuit

Into the box

The unit is now ready to mount into a suitable case - the one indicated in the parts list will allow both this board and the input board to be mounted in a single box (the input board will be mounted above this one). Having chosen your box you must now mount the output sockets and the isolating switch, as in Diagram 4.

If you have mounted more than two mains units in one box you can of course use any suitable output socket, so if you have all eight mains sockets in one unit you could use a nine way D type socket and connect it with just one cable.

The isolating switch enables all outputs to be switched off simultaneously; it also allows the unit to be set up by the computer without any mains devices being switched on accidentally.

I have also included a cold start Reset switch. Pressing this will cause the computer to reset to the initial power-on state without actually having to turn the computer off - very useful for recovering from a crash or machine-code loop, though it does reset the basic pointers too (thus effectively losing a Basic program in memory). Any machine-code programs will be unaffected by a Reset and can be restarted with a SYS command.

Turning on

The unit must be plugged into the computer prior to switching on - connecting it with the power on can easily damage one of the ICs. To test the Control Board, plug it into the computer, then plug the Mains Control Unit(s) into the output sockets and also into the mains.

Switch the computer on, switch the isolating switch on, then test each socket in turn; all mains sockets should be 'ON' now.

POKE56578,15: POKE56577,0
for the 64, Or, for the Vic 20:

POKE37138,15: POKE38136,0

Reset all mains sockets (which should now all be ON). If either of these tests fails, switch off the computer immediately and check your board very carefully.

It all well you can now type in the control program - note that there are different versions for the Vic 20 and the 64. This allows you to switch the mains devices on or off by pressing either the + or - keys followed by the

Projects

device number A screen indicator will show the state of all devices.

Once you have typed and saved the program you can complete the final test. This checks that the outputs respond correctly, pressing '+4' should turn on mains socket 4 for example, and '-4' should switch it off again. Test all sockets in turn and then in combination, if any tests fail then you have either made an error in the circuit board or in typing in the program.

Using the Control System

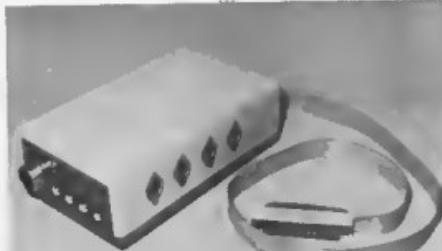

When using the control system the isolating switch should always be OFF until the program is loaded and run. This is

system while the line remains high. (1)

Lines 310 and 330 show its use (it is set up by the DDIR at address 86378 for the 64, 37138 for the Vic). By using similar code in your own programs you can set sockets to switch on at certain times of the day or night, switch lights on and off while you are out or turn the heating on at pre-set times.

When typing in the programs note that the standard display control codes have been expanded to meaningful strings, e.g. - CLR~ = Clear screen and -CD~ = Cursor Down etc. You must replace these strings by proper codes.

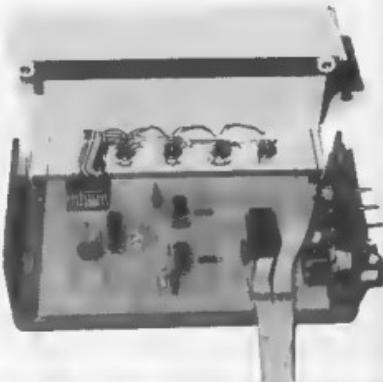

There will be a program at the end of the series to allow

The completed prototype unit shown without the isolating switch. (The sockets and switches to the right of the reset switch are for use with the input board)

because the computer sets up the User Port on power-up with all lines set as INPUTs and in any case the state of the devices on the control board is indeterminate when power is first applied. Once the User Port has been set up correctly and all devices switched off, you can turn the isolating switch ON.

The code needed to use the control system is all contained in the demonstration program. Lines 150 to 200 set up the control interface and lines 290 to 330 carry out the control functions. Note that one line from Port A (PA2) is being used to enable or disable the 4 to 16 decoder chip (C28 on Vic). Only when this line is set low (0) will the User Port affect the output. You can therefore use the User Port for other things without affecting the mains control

The interior of the prototype unit showing connections to output sockets

you to do all these things in conjunction with the input board as well. In the meantime, the only restriction is your own imagination...

That brings us to the end of Part 2 of the series; next month I will be covering a commercial unit that allows control through the mains wiring itself and a constructional project to build a remote control system using an Ultrasonic link.

Commercial control units

For those people who would like to expand their computer to control functions but have zero constructional ability and/or facilities, here are details of some of the commercial control units I have managed to find working with the Commodore range of computers

- L.W. Staines & Co. is producing an eight-bit controller board (Interface 2) which could be used for main control with suitable relays; it also has similar motor control interfaces for anyone wanting to experiment with robotics. A review unit has been promised, but had not arrived by the time this article was written - if it turns up, details will be included later in the series. Prices are from £25 and the suppliers can be contacted at Unit 2, Rodding Trading Estate, London Road, Barkingside, Essex IG11 8BU - telephone 01 591 2900.

- VIC-REL is a cartridge unit which plugs into the User Port and will control six output and two input lines. It is limited to a maximum voltage of 24v DC on the output lines and you will

PRICE BREAKTHROUGH

Now only £59·95 inc.V.A.T.

VHS and VHD recorders

With our price breakthrough you can buy all these components direct from us:

- VHS recorder: Video Camera (Model 100) - £49.95
- VHD recorder: Video Camera (Model 200) - £69.95
- VHS recorder: Video Camera (Model 300) - £79.95
- VHS recorder: Video Camera (Model 400) - £89.95
- VHD recorder: Video Camera (Model 500) - £99.95
- VHD recorder: Video Camera (Model 600) - £119.95

Now available is a breakthrough for the VHD model. The new Super 8 camera, INTERPOD 700, is now available. It's a super 8mm camera with a built-in motorised motor drive. It's a superb addition to your existing VHD system or it can be used as a stand-alone unit.

With options on the VHS model of the camera you'll be able to buy a Super 8 camera with a built-in motorised motor drive. This will give you the ability to take full advantage of the camera's features.

INTERPOD 700 is a Super 8 camera. It's a camera that's designed to be used with a Super 8 camera. It's a camera that's designed to be used with a Super 8 camera.

Using INTERPOD 700 is very simple.

Simply plug INTERPOD 700 into the video input of your VHS recorder. Then connect the camera to the video input of your VHS recorder. You can also connect the camera to the video input of your VHS recorder. You can also connect the camera to the video input of your VHS recorder.

Taskset in profile

The view from Bridlington

by Bohdan Buciak

Taskset is a relative newcomer to the make or break world of home computer games; it's been trading for little over one year. But its protagonists cut their teeth earlier than most by producing games for real arcade machines.

Now they've turned their collective attention exclusively to the Commodore 64 and have produced a string of eccentric yet original games that seem to pop up regularly in the games charts. Bohdan Buciak took the stopping train to sunny Bridlington to meet the creators of *Rankin' Rodney* and *Bozo*.

Andy Walker was born just down the road from Taskset's new premises on Bridlington High Street. He's managing director of the company, and probably falls into the 'local-boy made-good' category, whether he likes it or not. He's now in his mid-thirties, sports a Noel Edmunds hairstyle and beard and has done time working as a civil servant. Not an environment conducive to producing game-mania. So how did he get hooked on computer games?

"I spent a considerable number of years working with computers at a government electronics centre," he declares cautiously. "That was a few years back, when microcomputers were just beginning to make their mark on the mainframe and minicomputer market."

Walker saw the potential immediately and became fascinated by micros to the point of distraction. But his enthusiasm couldn't

persuade his superiors to send him on small systems courses to find out more about micros. Walker considered that to be somewhat shortsighted. "They didn't believe the future lay in small systems." So he built an antipathy towards the Civil Service and started building his own micros.

He eventually left, having decided that he wanted to do nothing more than devote his time to writing video games. He managed to inspire another programmer and a video artist with his own brand of enthusiasm and together they set up AWL Electronics, a company who's major claim to fame was writing games like *Andromeda* and *The Pit* for the true games arcade consoles.

From arcade to home

But nothing seems to last long in the computer games industry. "The

writing was on the wall for arcades", recalls Walker. "People were ripping each other off blind producing anything but original offerings. In any case, the growth market was in home computers - you can't put a keyboard in an arcade." By that he means the sophisticated game control you get from a keyboard couldn't be incorporated into an arcade machine - keyboards are a mite too delicate for arcade tappers.

Andy Walker's arcade experience told him that the two ingredients for success are spectacular graphics and good sound. But that wisdom left him with nowhere to go, a home computer he could do justice to those two requirements still hadn't appeared. As far as Walker was concerned, anyway. Maybe his standards were too high.

But he was immensely unimpressed when the Commodore 64

appeared on the scene, its sprite graphics and its VIC chip. "We bought a few 64s and took them apart, and found that the VIC chip does the same as a board-full of chips on an arcade console - what an awakening for me." Walker, without hesitation, produces a circuit board the size of a drinks tray for anyone who doesn't believe him.

And his views haven't changed since. "The 64 really is the best value machine on the market. The technology you're buying for the money is terrific. The screen editor is terrific too." Trouble is, Walker can't comment on its BASIC, he doesn't know the language. But on the strength of what he saw, Walker adopted the 64 as his main machine.

So Taskset came into being (at a time when Jetpack had just appeared on the Spectrum), with a team of programmers nurtured in

arcade work, working for a machine they reckoned could display their talents to the full. But why choose an unusual name like Taskset? Simply because they needed to become a company quickly, so they bought a name off the shelf. Walker felt it sounded reasonable.

Bags of ideas

Taskset didn't need to adapt its working routines to write for the Commodore 64, the team carried on creating games in their accustomed way. "We carried on operating what we call an ideas bag," explains Walker. The bag is actually a board hanging behind Walker's desk upon which people scribble their ideas. "We also run regular brain-storming sessions in which lots of weird and wonderful ideas get thrown around." But the casualty list seems high - about one in every twenty ideas actually becomes a game.

And the real mainstay for Walker is originality, probably a hangover from his experience of arcade games and something he'd really like Taskset to become known for. "You've got to be able to junk ideas, even if someone comes out with a game that you've already done - a great deal of work can be done there," Walker reckons he's already done that - probably not many other games houses could make the same claim.

And the theorising continues

apart from originally what we'd aim for in a game is relatively simple rules but a high standard of presentation. There's no reason why graphics shouldn't be good and music shouldn't keep tempo with the action."

And do Taskset's games live up to all those aims? On Cormic Convoy, its first game, Walker has doubts. The most he'll say about it is that it was an original offering. But he'll really wax lyrical when pressed about Pipeline and Jammin', both of which have been remarkably successful.

Pipeline came out of an ideas bag we had when we were still writing for the arcades. We'd had a burst pipe at the office one night, dripping water perilously near to some expensive hardware. The plumber came next morning and it developed into a really crazy situation - weekend galore, one guy holding a spanner while three others watched. So the idea went into the bag and eventually surfaced, albeit a little transformed.

"It's a simple game, but it was a long way advanced over my competitors, especially in terms of music," enthuses Walker. He plays the game almost reverently "so simple, the idea is to engender panic; you can win if you keep your head, not many people get past pipe ten..."

Rodney and Bozo

Pipeline set the trend for a success-

sion of games characters, like Rankin' Rodney in Jammin'. That game stemmed from Tony Gibson, Taskset's reggae-loving musician, who hero-worships the late Bob Marley - hence the game's strong red, gold and green colours.

Walker probably reveres that game even more: "nobody had driven the 64's sound chip like the before Jammin' has a drum, bass and melody line, and it all keeps time with the action, it's truly interactive. There's no keyboard involved either, just connecting instruments so that they'll play to you. And the baddies are built just to burn notes."

Whether you like the game or not, there's no denying that both the music and graphics are brilliant. The tunes either obsess you or drive you mad.

Then came Bozo, the unsteady anti-hero of Bozo's Night Out. That's Taskset's most original and bizarre offering to date. But games that include a drunk, a bunch of nuggers and sweet painted ladies will inevitably offend somebody somewhere.

Walker is quick with his defence: "Bozo is a reasonable idea. And I don't think there's anything to alienate youngsters. Alcohol is never mentioned - it's wobbly juice. An awful lot was cut out so as not to be offensive." One idea that didn't quite make it was a bladder that would fill up as Bozo drank the problem of employing a proved unsurmountable - probably a mixed blessing.

That prompts Walker to make a few generalisations. "There's a lot of arguments for us to wrap up what we want. For example, we'd write a political game whether it defended a political party or not. We are our own masters. We back games with our own money, and you please yourself whether or not you buy them."

The assertion of independence seems to pervade the writing process itself. "We never advertise for games contributions and we don't buy anything in. If a game is not written here, it doesn't get published."

And writing itself is always done as a team. "I'm not saying individuals aren't important," asserts Walker. "It's just that the process is too big for individuals. The best way forward for Taskset is to gather a team of specialists; everybody is good at what they do."

Getting to the chips

Having decided to use an IDE, what are the mechanics of writing a game? Walker quickly asserts that all writing is done in machine code and nothing else. "I don't like anything going into the chips. He doesn't know basic anyway and probably doesn't want to."

To make the writing process easier, Taskset has invested heavily in development hardware. So far as the Apple II macros (they go with the 6502 processor similar to the 64's) they use as development machines running the Macintosh assembler package. Then there's the Orangepipe local area network. To connect the computers port A to all the Apples, enabling them not only to transfer programs and data to each other but to share a 10-megabyte Winchester hard disk which stores all the work done and can be accessed by anyone on the network.

Not only that, Taskset has spent a great deal of time writing stock utilities. "We couldn't buy the utilities we wanted so we wrote them ourselves; they all link together. We've written a couple of machine-code monitor tools. Another example of that modicum of independence."

More recently, Taskset discovered the Koala Pad graphic tablet and is now using it to generate graphics, having written their own utilities for it. "The impact has been enormous," enthuses Walker. "You can generate in a day what would have taken a week to complete. That means we can afford to experiment with ideas as much more."

Walker insists that the only utilities taken won't make Taskset ge-

Profile

duce games more quickly. "We can produce games quickly because we're a small company, and machine code won't rush. We don't want to either; I don't want Taskset to become a big conglomerate. We're staying small so that we can all be Indians" - by that he probably means everybody stays a part of the team and gets equal shares in the glory.

But Taskset has grown despite these assurances, and Walker has taken on an accountant and a marketing man, suitably called Andy Nuter, to allow him to do what he enjoys - write games. And probably to shark the mundane yet essential job of administration.

Computer games is now big business, no longer the cottage industry of yore. And Walker won't hesitate to stress the importance of good management, especially when bankruptcy casualties among software houses are becoming uncomfortably regular. But he'll claim intransigency as the main cause of a company's demise rather than the advances of organised game counterfeitors.

"I don't think piracy is responsible for any software house's downfall. We've been badly hit too. And we're doing something about it! I hate it because it involves me in a lot of work and money, and that offends me." What he's doing is embarking on a long and tortuous period of legal action. Taskset could join the Guild of Software Houses and take joint action. But Walker hasn't got round to it. "It's just not the all-important problem."

Making plans

With the future of some software houses being abruptly curtailed, what kind of plans has Walker made for Taskset? "We have to be international in our outlook; it's no good being in just one country. You've got to be in Europe, which means providing games on disk because the disk market is much bigger there. We've also got links with America from the old days, which we're using to good effect."

America is probably a throw in the tide to many British game houses as American software sells

rather well in this country. Walker asserts it doesn't bother him. "It was bound to happen. The games are generally of very good quality and it's good healthy competition. So we can only welcome a move like that. The real winners are the customers. They're getting a really good deal."

Time for some more home spun Walker philosophy. "Customers have a lot of power. If only they'd realise it! They have the power to reward or break software houses. For example if people don't like Bono it would put them off everything else we do." And inventing that theorem Bono fans will invariably turn to Taskset for future games.

So Taskset is determined not to produce inferior games. It's all a question of credibility. Or, as Walker puts it "we want to be known for original entertainment, and I'm quite happy with that as my major aim. We're not interested in business or utility software. We write games and we think we're good at it."

But will Taskset's future games

continue to be exclusively for the Commodore 64? After all, Commodore has just announced the 16 and Plus 4 models. Does Walker regard these as true gaming machines? The answer is characteristically abrupt. "I won't even look at the 16, and with the Plus 4 the answer's a qualified 'no'. It's got no sprites and they've thrown away the SID chip. It's madness and a step back for the gaming world. Neither of them will sell better than the 64 and the 64 will be around for a long time. Commodore couldn't kill off the demand if they wanted to."

Certainly, software houses continue to clear out innumerable games for the 64. Taskset doesn't work quite that quickly but it is currently launching two new games. The first, *Poison Painter*, involves a character called Bill Sticker. And if you're reminded of a seaside postcard, you won't be surprised that the second game is called *Seaside Special* - must be something in the Bridlington air.

Our regular round-up of games reviews

We get to see a lot of games here at Commodore User, so many in fact that we can't handle all the reviewing ourselves - we farm out some of them, which is why our reviews have someone's initials at the end of them. We look at everything we get, but we don't necessarily print all the reviews we write: instead, we tend to stick with (a) all the best games we come across and (b) those games that you're most likely to find in the shops or the mail order ads.

ROMIK SOFTWARE
PRESENT
SPACE FORTRESS
FOR THE UNEXPANDED VIC 20

"A REAL ACTION SHOT OF THE GAME
WILL YOU BE THE SUPREME WORLD CHAMPION?"

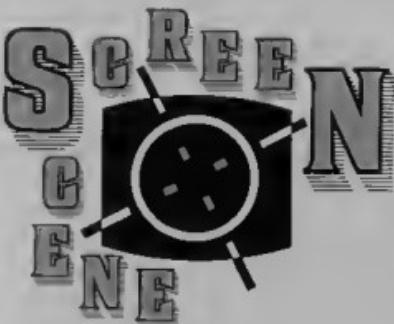

SPACE FORTRESS
VIC-20 (unexpanded)
Joystick or keyboard
Price £5.99

You are a space game fan with a basic Vic looking for some real action. Space Fortress is certainly a good "shoot-em-up" requiring timing, together with an awareness and anticipation of the enemy's tricky flight paths. There are four waves: the green suicide squad, blue sidewinders (these and the following drop bombs), cyan swoopers and lastly, purple aliens.

Each formation attacks in a different manner in an effort to relieve you of a life. Your defence is marked by effective "thumping" sounds standing out from the background noise of cosmic wind. The high point is obviously the appearance of the eponymous "awesome mothership". Scrunch it quickly before the force field has a chance to lout, then take the next step towards level 20. LS

Value for money:	*****

SPACE SWARM
VIC-20 (unexpanded)
Joystick only
Price £5.99

This is a pale shadow of Arcadia although at least the playing area is wider; and the top five scores are retained. The vertically expanded screen displays the crawler which must be survived by your largest green spaceship before its next wave is summoned up.

The first three opponents are alien craft with a tendency to drop bombs and do present a challenge, but the so-called fireballs in wave four are non-existent. Not so the meteors on the fifth frame as they race in at all angles, calling for constant avarage action. After that it's round again but with your opponents having undergone a popular explosion. Unlike Arcadia you cannot move vertically, also your rocket slows down towards the end of each phase thereby increasing the likelihood of a collision.

Again compared to big A the alien forms are dull (scary chap! More camping is the intent as opposed to illustrate the game prominently) and who conjured up the score? In isolation not bad but Space Swarm really does suffer by comparison to an established title.

ROMIK SOFTWARE
PRESENTS
INSECTOR
FOR THE UNEXPANDED VIC 20

A REAL ACTION SHOT OF THE GAME!
WILL YOU BE THE SUPREME WORLD CHAMPION?

INSECTOR
VIC 20 (unexpanded)
Joystick only
Price £5.99

An adaptation of Defender which will only prove suitable for those able to cope with ultra hectic everything-happening-everywhere simultaneously scenarios. A black horizontally expanded screen (the Vic can still reach the 84 x track or two) at first displays two yellow bomb-dropping mega-insects, just out of range of your red wedge shaped interceptor soon to stalwartly defend the purple humans coexisting in their burrows.

Only two? Yes but as the green leaders scoop up specimens of homo-sapiens and, perchance evading your withering laser fire, reach the top of the screen they will mutate to increase the insects' numbers. Soon yellow pods will appear despatched by the insects, only to suspend cyan spreaders which vastly increase the shower of bombs raining down above, in fact there comes a time when the planet resembles a nucleophilic snow storm.

After a few mad runs, you get down to business, the addictive quality of the game will dawn on you, simply trust - surely you can contain the invasion without the whole thing careering beyond your control, nexttime.

Comprehensive instructions precede the main program which features sixteen speed levels, thumping pulsating noises, "howling" wind effects and an interesting screen display. If you fancy a challenge demand a demo of Insector. LS

Book

FALCON FIGHTER
VIC-20 (unexpanded)
Joystick or Keyboard
Price £6.00

A horribly addictive example of Scramble adapted for a spartan 3.5K. I managed five stages at speed 1 (choice of four speeds) and was unable to detect any flickering often associated with scrolling landscapes with the Vic. The border changes colour to match that of the sector, which makes things easy on the eye and sets off the white flight area nicely.

The first stage, green mountains, gives the opportunity to bag a few ground targets and gain practice in avoiding the omnipresent multi-colour space mines. The blue cavern provides the challenge of purple meteors, then out in the open again, red signals the presence of missiles. Sector four, purple, is well peppered with bolting scorpions, while another blue cavern (still with mines) revamps the tricky mussels. That leaves three sectors unexplored, but I'm willing to bet there's no maze.

The explosions are awful only, unless you count rapidly alternating screen colours, there is no damage. The high decibel background noises are supplemented by "plummeting bomb" sounds and the occasional bell as your rocket collides with obstacles.

Apart from stockmung-up with fuel in the time honoured manner, ammo dumps have to be blasted for a supply of bombs, run out of these and you will most decidedly be in a Catch 22 situation. LS

Amazing how played out some things

ys become.

Will you think the same of your micro in 6 months' time?

Remember the days when every record player was gifted with a needle instead of a stylus, 45's were "in," 78's were "out."

Before the days of hi-fi and laser discs. When a graphic equaliser was a breakthrough on the football pitch instead of in music technology.

Look at a record player now and it's a museum piece.

It's like that with micros too.

The machine you thought would give endless hours of fun and interest often becomes a five minute wonder. Played out within months. Or so you thought.

But imagine communicating with other micro users on a nationwide mainframe system. Updating yourself

daily with the very latest computer news and reviews. Paging a special Bulletin Board. Feasting from Prestel's vast menu. Even downloading a choice of software *absolutely free*.

In fact, imagine 30,000 pages at your fingertips and you've imagined what it's like to be on line with the Micronet 800 system.

For just £13 a quarter (and, for most of you, a local telephone call whenever you want to connect up) you could subscribe to the Micronet system.

The only extra you need to connect up is a modem unit. Which is a small enough outlay for what it buys.

Micronet's learsures are almost limitless and constantly updating so why not see it in action at John Lewis stores, selected W.H. Smith shops and Spectrum UK dealers.

Or fill in the coupon for our brochure.

You'll find you won't want to play on anything else.

Please send me the full facts about Micronet 800.

One person alone could go with Pitfall Harry into the Lost Caverns... You!

Pitfall II Lost Caverns

Running on
Commodore 64, Sinclair Spectrum &
MSX System at your usual software store.

Oh Harry. This time he's gone too far.

Somewhere, buried deep in the lost caverns of Machu Pichu, Peru, lies the stolen and, of course, priceless Raj Diamond, along with a hoard of missing gold bars.

Harry's little niece Rhonda and Quickclaw, her cowardly cat, are supposed to be with him, but they strayed away and are lost in the bowels of the caves.

A wealthy university has asked him, while he's cleaning this mess up, to capture an elusive stone-age cave rat.

What fun.

He just has to avoid the occasional poisonous frog.

Oh yes. And the wickedly clawed condors.

The electric eels. And a very nasty line in thirsty vampire bats.

So you can see Harry could do with some help.

All you'll have to help you are your wits and some gas-filled balloons to bridge the wider chasms. And you'll be in for the game of your life.

One thing puts Activision Software out on its own. The way you go on running it month after month. And Pitfall II is no exception.

Lose yourself in the world of

 **ACTIVISION**

Activision Software is available at selected branches of WH. SMITH, BOOTS, RUMBLEOWERS, SPECTRUM and all good computer shops

Hi-res Plot

by Jason Dobbs

This neat little program allows you to use a joystick to draw on a cut-down 152 by 160 hi-res screen, and produce a printout of your work. But you'll need at least 8K of expansion for your Vic. According to Jason Dobbs, the program works well with the Commodore 1515 printer, but it should also work with newer Commodore printers.

Because the panel on the screen is rectangular rather than square the printout is usually a little longer than the picture on the screen.

To run the program, you must put the start of BASIC memory to \$E9. That's not too difficult; you merely enter

POKE4,32: POKE\$192,0: NEW (return)

before you load the program itself. The program takes a little time to initialise, but you should eventually see a blue screen, a green border and a yellow cursor position. If those colour combinations don't please you, they can be altered by changing the values in Lines 20 and 1005 in both cases, you need to change the numbers immediately preceding the last colon.

To operate the program, you use the joystick. A few special keys are used too:

- **P** lets you print your design.
- **CLR** is used to clear the screen (be patient, it takes a little time).
- Keys from 1 to 9 are used to change the amount the cursor moves in one step.
- **F1** draws a line between the spot where F1 was pressed and the spot where you pressed the fire button.
- Pressing the fire button in the same way, but without pressing F1, erases rather than draws.

```

Escape

by Rupert Willard

Don't be fooled by this title, this is a version of that screen classic and hardy perennial game, *Breakout*, for the unexpanded Vic. Of course, it doesn't incorporate the intricacies of play you'd expect from the original. And it ends as soon as you've broken out at the top of the screen.

But there are some nice touches like the authentic pingpong sounds, a high-score facility, choice of up to nine servers and the full quota of six barriers to bust through. Pressing **Z** moves the paddle to the left, and **C** to the right.

СТАРЫЕ

Level 9 Adventures are superbly designed and programmed, the contents first rate.

YOUR 64 June 84

Whichever machine you own, if you have the vaguest tendency towards adventure playing then you must try one of these games (unfortunately you'll probably end up wanting to buy the lot!).

Computing Today, August 84

To me, all Level 9 adventures create a remarkable atmosphere because the descriptions sound so life-like. This is where so many other adventures fail.

Crash, July 84

But it's not just the size of the game it's the quality as well that is astonishing ... scenes to fire the imagination.

PCG, April 84

As in all Level 9's adventures, the real pleasure comes not from scoring points but in exploring the world in which the game is set and learning about its denizens.

Which Micro?, February 84

... of the year,

Adventure Quest

Level 9 Computing

Adventure Quest is the second in Level 9's acclaimed Middle Earth trilogy, though it can be played by itself.

Available from W H Smith and good computer shops everywhere. If your local dealer doesn't stock Level 9 adventures yet, get him to contact us on: Centresoft, Microdealer UK, Ferranti & Craig, Leisuresoft, Lime Tree, LVL, PCB, B & R or Wonderbridge.

I thoroughly recommend these Adventures, they are excellent value for money. No self-respecting Adventure-addict should be without them. I believe Level 9 are producing a series of Adventures which should be regarded as classics.

Atari User, July 84

These programs run very fast and there are no frustrating pauses. Level 9 Adventures are superbly designed and programmed, the contents first rate. The implementation of Colossal Adventure is nothing short of brilliance; rush out and buy it. While you're at it, buy their others too. Simply smashing!

Your 64, June 84

Level 9 — arguably the producer of the best adventure games in the UK — has done it again. LORDS OF TIME is a sparkling addition to its stable of winners.

Acorn User, July 84

(SNOWBALL). This is another imaginative, massive-scaled immensely enjoyable adventure from those experts down at Level 9 Computing.

Your Computer, March 84

Level 9 specialise in huge adventure games, cramming over 200 locations and a host of puzzles into your micro. We take care when designing games—writing them like stories with detailed settings and sensible reasons for the puzzles. They are solved by inspiration—not luck.

1. COLOSSAL ADVENTURE

The classic mainframe game "Adventure", with all the original puzzles plus 70 extra rooms.

2. ADVENTURE QUEST

An epic puzzle journey through Middle Earth

3. DUNGEON ADVENTURE

Over 100 puzzles to solve and 40 treasures to find.

4. SNOWBALL

Save the interstar freezer, Snowball 9, in a huge space adventure with over 700 locations

5. LORDS OF TIME

An imaginative romp through World History.

I enclose a cheque/PO for £9.90 each

Victor

Three scrolls for the Vic

by Neil Phillips

Ever wondered how professional programmers produce those dazzling scrolling effects? Neil Phillips reveals all with these three short routines.

Horizontal scroll makes a single bar of text move across the screen. Vertical scroll does the same but this time it's up and down. Finally, there's a routine to scroll the whole screen towards the top. Happy scrolling.

Vertical scroll

```

Turning tortoises into hares

The 1541 Express cartridge reviewed

by Kevin Bergin

The Commodore 1541 disk drive has an unhealthy reputation for sluggishness, to the extent that cassettes with a 'Turbo' facility load just as quickly as disks. And there's nothing you can do about it.

Well, not quite. Now you can buy the 1541 Express cartridge from Ram Electronics. It connects computer and disk drive via the 64's cartridge port, and claims to let you load and save files from the 1541 at more than double the normal speed. That sounds pretty impressive but is it impressive enough to warrant its hefty £49.95 price-tag?

What you get

For your money you are supplied with a cartridge that plugs into the 64's cartridge port. And there's a short eight-page manual to help you install and use your new device.

But before you can use the 1541 Express you must face the somewhat daunting prospect of connecting two wires which are attached to the cartridge, to two chips inside the 64. This means that you must take the lid off the 64 and this could affect the warranty, so be warned.

The two wires that dangle from the cartridge are labelled #510 and U14. These are the names of the chips that the wires must be connected to. Both wires have a small grip on the end of them so that the connection is secure, but easily removable.

The wire marked #510 is connected to pin 28 of the processor chip and the wire marked U14 is connected to pin 15 of the chip marked U14 (in fact the chip is not marked U14 at all, it's on the board beside the chip). It's far better to run the wires through the back of the 64 so that the casing can be closed properly and securely.

Don't worry about connecting the wires to the wrong pins, you won't damage anything. The cartridge simply won't work and you'll just have to check the connections again. Having connected the wires to the correct pins the 64 should be put back together again and the cartridge inserted into the cartridge slot.

When you power up the 64 with the 1541 Express properly installed, you'll see three lines to

the power up message instead of two. The second line should give the product name and copyright message. The amount of RAM though, is not affected; there are still some 38911 bytes available

Operation

Using the cartridge is very simple and smooth. When the 64 is powered up with the 1541 Express installed, the two function keys F1 and F3 are set to toggle between fast and slow mode. In other words, the normal disk access time may be used with the cartridge in place by pressing the CTRl key and the F3 key together; the screen will flash once quickly to show you the command has been accepted.

To get back to fast mode simply press 'CTRL' and 'T' together. Again the screen will flash once, although this operation takes a little longer. Holding down the 'SHIFT' key and pressing 'RUN/STOP' will load and run the first program on disk. The cartridge changes the default device to disk. So files can simply be loaded in the form:

LOAD "<FILENAME>"
<return>

There is no need to enter the device number or close the quote; the usual abbreviations are accepted.

Ram Electronics claim up to three or four times the usual access time. But the actual speed is more like double on average. Above are some timings for loading and saving both programs and word processing files with

	Normal	1541 Express
Loading 33K program	84 secs	39 secs
Saving 33K program	91 secs	66 secs
Loading 34K w/p file	112 secs	66 secs
Saving 34K w/p file	92 secs	66 secs

and without the 1541 Express cartridge

These tests are all approximations but they do show that the cartridge doesn't actually achieve three times normal speed. They do however show a large speed improvement particularly with normal programs, as opposed to files loaded and saved from a word processor.

The 1541 Express will work with Easy Script, Paperclip and (I am informed) most other soft loaded word processors. From the tests I found the disk access time was generally reduced by half.

Using other software such as utilities and Basic extensions does not have any adverse effect. Even if a program does conflict it is often possible to load and run it by switching to normal mode

Buffer space and Sprites

The 1541 normally objects to sprites being on the screen whilst the disk is accessed, but not so with the cartridge installed. You can display sprites and still have access to disk.

The cartridge reverses one of the drive buffers reducing the number of files OPEN at any one time from three sequential files, or one sequential and one relative file to two sequential files or one relative file, in fast mode

You can also use a modem with the cartridge. This allows even swifter downloading of programs. However if you want to have more than one device connected to the 64's serial port whilst using the 1541 Express, you will have problems as it will only access one. So anyone who has a 1541 and a printer connected via the serial bus or two 1541's will not be able to use the cartridge with more than one of these devices.

Ram says it is going to make a cheap cable that will allow you to have two drives, or a printer and one drive connected whilst using the cartridge in fast mode. The cable will also have some other features. No details as yet, we shall have to wait and see.

At present, depending on what printer you are using and how it is connected, the cartridge may work in slow mode with your printer. Two single drives may be connected with the cartridges installed, but only accessed in slow mode.

The code for the cartridge is invincible, the normal cartridge space is \$3000 to \$5FFF hex but upon examination there was nothing there. The space that normally occupies the ASCII code for the power up message has some strange code and the area from \$DE00 hex onwards will not disassemble. So for those who are curious, this should provide some challenges.

Review

Documentation

This is the area that's sadly lacking as is so often the case. The manual is a mere eight pages long and the presentation is not nearly as professional as the product itself. Thus slum time covers the installation of the cartridge, the operating instructions, limitations of the cartridge and working with other peripherals. But it gives only a few notes for programmers.

There could be a great deal

more explanation of the cartridge in general and the problems that might occur in using it with other peripherals. It's pretty obvious that you're going to have problems using cartridge-based software, say, a word processing package, to access files on disk. A few demonstration programs with documentation would not have gone astray, together with more information for programmers wishing to make extensive use of the cartridge and its facilities.

Conclusion

It's a shame about the manual, it could have contained a lot more information and the presentation could have been better. The other drawback is of course the lack of a cartridge port when using the 1541 Express; any cartridges you normally use, or wish to use, cannot be connected. And it seems that the only way around this is to buy an expansion board. Even then I am not sure if they would work

together; perhaps Ram Electronics will clarify this in the near future.

But the product does do what it claims. And it will save you a lot of time if you use your 64 and 1541 daily. The general standard of the product is very high and I have no hesitation in recommending it. In fact, since reviewing the 1541 Express I have purchased one myself. It is one of those products that you just have to have - that's if you can afford it.

Adding up the Plus/4

by Karl Dallas

It's now 'official' that the Commodore Plus/4 will actually make an appearance on your local High Street, having made its debut along with the less illustrious Commodore 16 at the recent Commodore Show. But the confusion and speculation about what role it will take on, and what gap it will fill in a market that's already bursting at the seams with new and newfangled hardware, rumbles on unabated. And then there's the inevitable competition from the Commodore 64 itself.

Karl Dallas has managed to acquire a pre-launch version of the Plus/4 (albeit without the ROM-based software) and has managed to fuel his own speculations with some hands-on experience, notably of its extended Basic and graphics facilities.

About 18 months ago I was feeling pretty pleased with myself, because I had secured an exclusive preview of Commodore's brilliant new CBM 700 128K business machine. Today stocks of the 700 are being sold off at bargain prices. Software companies who invested time and money in developing programs to take advantage of the machine's special fea-

tures are trying hard to recoup their costs.

The point is that when you are dealing with a company whose marketing of new products seems as capricious as Commodore's, the merits of any given machine may have little to do with whether it goes or stays. And when a new machine has as many question marks against its future as the new

Plus/4, that may be doubly so.

In the starting blocks

The Plus/4 comes on to the market confronted by some hefty opposition, not only from the likes of the superbly conceived Amstrad and the first of the new Commodore-standard MSX machines from Japan, but also from within Commodore it-

self. For in many ways, the Plus/4 seems to offer a less versatile and less compatible alternative to the already tried and tested Commodore 64, with more sophisticated Basic programming commands, but without the 64's superior (if complicated to implement) sprites facility.

Indeed, when I first saw the Plus/4 machine upon which it is based it

the Commodore Plus/4 previewed

At Hanover Trade Fair in the spring and later the annual Plus/4 at the Show in London, I must confess I was sceptical about whether Commodores were really serious. I still feel rather that way, but I am assured that as soon as Commodore's corporate move to Cosby has been successfully completed (and it's inevitably taken longer than planned), Plus/4s will start rolling off the production lines in time for Christmas. And software companies are working hard to have adequate applications ready at the same time.

The machine is intended to be a powerful package, with 32K of ROM, 84K RAM and advanced BASIC including graphics and sound commands. It has programmable function keys, and an integrated ROM based software package, covering word processing, spreadsheet, database and various graphics; it is planned to sell at less than £200.

But it won't run any other Commodore software and the peripheral sockets are not the same as for other Commodore machines (apart, that is for the well-known and even moreatty Commodore 16). However, I managed to run an ordinary 1541 disk drive from the serial port, and I actually found it easier, using an ordinary 5-pin DIN plug, to attach a monitor. With my 64, I had to make up a special lead.

So, possibly, the peripheral incompatibility is more a matter of having different plugs than any really distinct differences, though I see we are promised a "fast disk drive", the SFS 481, in addition to the Plus/4's version of the 1541, the 1542.

A clean machine

The computer I had access to was something of a "clean machine", without the integrated software, so a verdict on that will have to wait. It was also without any kind of manual, though I had access to some technical data that probably won't be in the manual anyway. I must say that after prolonged usage I was much less sceptical about its merits as a piece of hardware.

Surprisingly, it represents a real break with Commodore's past. Being more of a rectangle than the leafy skinny Vic and 64 shape which has also been retained for the 16, about half an inch wider and nearly 1½in deeper, but it's not as high, a mere 2½in compared

with the older machine's 3in at the back.

And it has two more keys ESC above CONTROL on the left and RESTORE has become a duplicate CONTROL. There are also four arrow shaped cursor controls. That means you require no shift for up and left cursor movement.

Two additional labels on the '<' and '>' keys at the bottom of the keyboard indicate a new function available. FLASH ON and FLASH OFF. FLASH ON is accessed in the same way as RVS ON, by putting it within a quoted print statement, but to switch off this facility you have to reposition the cursor in the same place. As you reach the bottom of the screen, and the text scrolls up,

Function keys

On power-up, the four function keys along the top left-hand of the keyboard are dedicated, respectively (unshifted/shifted), to print GRAPHIC/SNCLR (cr), DLOAD/DSAVE, DIRECTORY/RUN (cr) and HELP/LIST (cr). SNCLR clears the screen (like CLEAR/HOME) and those where I've indicated "(cr)" include a carriage return and hence immediate operation. It is impossible, therefore, to add any parameters to RUN or LIST, unless one rededicates the keys, which is quite easy to do with the KEY command.

The parameters for doing this

Commodore business system users (through the Basic used is described as Basic 3.0). These include DIRECTORY, DLOAD, DSAVE, HEADER (to format a disk), SCRATCH, COLLECT (to validate a disk and remove any unclosed files, etc), COPY, RENAME and BACKUP (available only with dual disks), to copy an entire disk).

No longer is it necessary to add the device number (still 8) in disk commands. DSAVE "filename" is equal to SAVE "filename". A DIRECTORY is the same as the "wedge" command available with the DOS support utility on the 84. Unlike LOAD "file" followed by LIST, it doesn't overwrite any program in memory. DIRECTORY can

the flashing character scrolls up as well, until it vanishes off the top of the screen. This makes things somewhat difficult.

Colours (including those accessed by the CBM key) and 16-res graphics symbols are printed on the front of the keys.

There are five screen modes, accessed by the GRAPHIC n command, where n is a number from 0 to 4 (0 is text (28 lines of 40 characters), 1 is hi-res graphics and 3 is multicolour graphics. Five lines of text are available on either of the graphics screens by invoking GRAPHIC 3 (hi-res split screen) or GRAPHIC 4 (multi-colour split screen).

are KEY a, textstring where a is 1-8 and textstring is the new text to be printed and/or implemented when the function key is pressed. Slightly confusingly, F2 is not a shifted F1 but the second key along, so that the keys are actually numbered F1/F4, F2/T5, F3/P5 and HELP/T7.

HELP is a toolkit command for identifying errors in program lines during debugging. Its key can also be redefined, but despite its position is FB.

The DLOAD/DSAVE options, of course, indicate the first instance where the Plus/4 is superior to the 64, in that it includes all the simple Basic 4 disk commands familiar to

be abbreviated DIR, making it a fast way of checking disk contents, program names, etc. The default parameter with all these disk commands is drive 0.

Inside and out

At the back and sides there are nine I/O sockets: 7-pin DIN socket (taking a 4-pin plug) for power from the familiar chunky Commodore transformer, serial 6-pin DIN, cassette 2-pin small cylindrical socket, user port, memory expansion (cartridge port), two 7-pin cylindrical joystick sockets (similar but not identical to the cassette socket), and video 6-pin DIN at the

back, and RF (TV aerial) out on the left by the RF socket; a low level switch, and on the right of the computer is a warm reset button and the power on/off.

The keyboard is quite pleasant to use. It's not quite as solid as the 64, certainly not a patch on the very firm, very quiet keyboard on the new business machines, but much less tatty, for instance, than the keyboard on the £300-plus Hyperion 28M-compatible on which Commodore is basing its promised PC localise machine.

Inside, the machine is very well laid-out, with the 46-pin TED chip which provides all the power for the Plus/4's various activities very much in evidence, surrounded by a fence of metal shielding. (Incidentally, no one can explain why it's called TED. We know that the SID chip's name in the 64 is an acronym for Sound Interface Device, but we have it on no less authority than Gail Wellington that TED ever meant anything, its meaning has been forgotten.)

TED can access up to 64K of memory for display information and it (almost said he) also controls video output, system timing, dynamic RAM control, ROM chip selection, and keyboard control. TED selects the 16 colours and eight luminance levels per colour, controls sound generation, controls the two speed clock and flashes the cursor (or any other character) twice a second (2Hz).

More powerful Basic

On power-up, the screen displays the usual opening array, with the difference that the Basic indicated is 3.5, of course, and there are over 50 Kbytes of memory available.

In all, Basic 3.5 has over 50 more commands and functions than the 64, including 'toolkit' commands used in writing and debugging programs. These include AUTO, DELETE, ERRS, HELP, RE-NUMBER, RESUME, TRAP, TRON and TROFF Structured programming commands, DO, ELSE, EXIT, LOOP, UNTIL and WHILE.

Then there's graphics commands: BOX, CHAR, CIRCLE, COLOR, DRAW, GRAPHIC, GSHPAE, LOCATE, PAINT, SCALE, SCNCUR, and SSHAPE. Sound commands include TONE and VOL.

There are now seven reserved variables in addition to the familiar TI and TI\$ time variables (the use of which is unchanged), there are also the disk status variables familiar to users of Basic 4. DS (status

number), DSS (status message), and ST (status of I/O operation), as well as EX and EL, which gives the error number and line number of a programming error.

Machine-code monitor

The direct command, MONITOR, invokes Tadmon, the resident monitor (which can also be accessed

- A**— assemble a line of 6502 code
- C**— compare two sections of memory and report differences
- D**— disassemble a line of 6502 code
- F**— fill memory with the specified byte
- G**— goto a specified address and start execution
- H**— hunt through memory for all occurrences of certain bytes
- I**— load a file from tape or disk
- M**— memory display of hexadecimal values in specified locations
- R**— 6502 registers display
- S**— save to tape or disk
- T**— transfer code from one section of memory to another
- X**— exit to Basic

seen via SYS 4 like the Pats) which has available a set of single line mnemonic commands (see table above).

The kernel routines seen mainly unchanged, although according to my data sheet, ICHINT has an address of \$FF81 (not \$FF84) and VECTOR is \$FF84 (not \$FF8D).

Plus/4 graphics compared

Undoubtedly, most hackers will turn to the graphics commands, although it's a pity we've lost the sprites.

On the 64, the bit-mapped hires screen is 319 wide by 199 deep. And the bit-mapped multicolour screen is 199 by 199. (The 64 reference guide says its screens are 320 and 160 wide respectively, but the effect is the same). The GRAPHIC mode command is obviously easier to invoke than the 54's POKEs and PEKEs, as is the spin screen, though text is limited to the bottom five lines.

However, text can be placed anywhere on a graphic screen by using the CHAR statement, so that

CHAR 1,0, "THIS IS THE TOP LINE"

will print along the top of the screen, 1 being the colour selected, the first 0 being the first column on the screen (numbered 0-39, not 1-40), the second 0 being the first row (numbered 0-34, not 1-35). The string can be printed in reverse if flagged with a '1' after, and turned off with '0'.

It's interesting to compare the Plus/4's DRAW command with the same command in MSX and on the

ellipses, octagons and stars diamonds and triangles as well as proper circles, depending on the parameters specified. The non-circular shapes are chosen by specifying 120 degree angles between segments of a triangle, 90 degrees for a diamond, and 45 degrees for an octagon. The default setting is two degrees.

Colours are specified from best by allocating one of 16 to enter background, foreground (as characters), multi-colour 1 or multi-colour 2, or border, with an optional luminance parameter 0-7. The default luminance is 7, the brightest.

In all drawing commands, the colour parameter has to be chosen from one of the five areas already defined.

PAINT will fill the shape created, either with the same colour as the shape outline or with a definable foreground colour.

The shapes so created can be SAVED or recalled by use of the SSHAPE and GSHAPE commands.

It is clear, though, that the graphics capabilities are designed for more serious applications than games, and the sound facilities are likely to be more useful for voice prompts than for space invader explosions. For instance, one software house already has a sound processor with spoken instructions supplementing the screen prompts almost ready for commercial distribution.

Conclusions

Despite its appearance, the Plus 4 is not the Mickey Mouse machine it may seem, though whether its target market of small-to-medium businesses will believe that, remains to be seen. The problem is that the market won't be very concerned about its merits of powerful Basic, and to the end technician it has very few advantages over the already established 64.

Its graphics capabilities, as basic of programming from BASIC, are quite powerful, but the lack of any kind of sprite manipulation must put it in a poor second to comparable machines like this facility.

A lot will depend upon the qualities of the ROM-based software, and how much appeal voice-based business packages are likely to have.

My scepticism about its future is less pronounced as a result of actually using it. But need I say I've had my hands on a production machine and looked at the ROM-based software, it's not entirely dispelled.

Adventure

Into the Valley...

Opening up a new adventure series

by John Ransley

You're probably familiar with the scenario of the Richard Shepherd graphic adventure *Urban Upstart*, which head-bangs your usual quaint fantasy foes and dropping dungeons in favour of a curiously chilling contemporary encounter that makes *A Clockwork Orange* seem about as violent as a round of arm-wrestling with Quentin Crisp. But it's a bit much when the approp extends to the practicalities of playing the game itself.

I found out the hard way that *Urban Upstart* takes a particularly uncompromising approach to the task of letting the player save a game to disk at any point. Instead of just cutting a fresh track on your own disk in the form of a sequential file, as seems to be the accepted convention, *Urban Upstart's* Save option first totally reformats the disk you use. In other words, it wipes any and every single program already on the receiving disk to capture (which left me wearing a fixed grin of resigned exasperation, like one of those Olympic synchronised swimmers) just a single-track sequential file holding the few variables concerned.

There is no warning of this novel consequence of a Save in either the program notes or screen prompts, so I hope you read that before you lose, as I did, a great wad of keyboarding by taking something for granted I can't fathom. Why *Urban Upstart* totally reforms instead of simply opening and closing a file in the usual way, but if one

program does so, there's a good chance that others do, too. The lesson learnt is that it must be a good idea to test Save any new adventure in your collection, using a blank or expendable formatted disk to do so.

Across the pond

Signs are that after a pretty inspired start Thorn EMI mean to mix with the action in the UK software charts and it's thanks to them that some of the top-rated titles from American software house Has-Ware are now becoming available this side of the pond. First offerings include a splendidly elaborate four-level arcade adventure for the Vic-20, *The Pharaoh's Curse*. But it seems that the anger of the ancients has extended to the packaging, because the tape version at least boldly proclaims that no RAM expansion is needed. It's a staggering great £6K of it. Makes you think twice about impulse buys, doesn't it?

Just what is adventure, anyhow? Already there seem to be four distinct categories. There is the pure text adventure, such as the original *Colossus Caves*, the graphic adventure, such as *The Hobbit*, the animated adventure *Valhalla* and the arcade adventure, like *Manic Miner* or *Alice's Adventures in Videoland*. Can anyone think of others?

Page the Oracle

You could call *The Oracle's Cave* from Dorcas Software an endless animated adventure, because not only does it offer four different quests but the cave layout is drawn afresh every time. This title received bad reviews when originally released for the Spectrum, and the version put out for the 64 shows why it's splendid.

You're faced with the tauntly conventional task of exploring a cave complex where you may collect useful objects and treasures, and do battle with a variety of fierce monsters with degrees of success depending on your weapons, current combat strength, and ability to recover from wounds.

The many options available through single key presses (what a timesaver!) including moving in any direction, slipping through secret passages, resting (it eats up time, though), exploring your immediate vicinity, and pleading for help.

A particularly nice feature of the game is that you have just five days to complete each attempt and a screen prompt shows the morning, afternoon and evening of each day slipping inexorably by as you delve deeper into the complex. Also constantly displayed on the lower part of the screen is lots of other helpful information, such as your combat strength and that of your current foe, the weapons and items you carry, and a map showing the tunnels you've explored, which is redrawn every move.

Meanwhile, the top half of the screen constantly displays a live view of your cursor location, including a tiny representation (looks a bit like Morph, actually) of your goodness, which walks along the scrolling caverns, wriggles up and down ropes and ladders, and attacks monsters at your com-

Adventure

through. The song on the cassette that the 64 tape version, price £7.95, uses the ultra-fair Fairlight system, which gives a reliable Load within a couple of minutes.

Even if, as a purist textual game you buy no other animated adventure, do treat yourself to the extraordinary quality of *The Oracle's Cave*.

Colour tip

An irritating shortcoming of most text adventures (and one found in the excellent Infocom titles) is the Henry Ford-type philosophy adopted when it comes to the matter of text background colour changes - or, rather, the lack of them.

Strange to relate there are those of us who find the 64's standard combo of blue on brown boring or a strain after a little time at the screen. One passes especially to elderly and others with poor eyesight whose enjoyment of a text adventure can be spoilt by the absence of the few lines of programming which can quite easily have the fault.

If you're writing an adventure yourself, here's a little sub-routine that will make it easy for you to avoid the thoughtlessness of most professional programmers and give players of your game a choice of 256 text/background colour combinations (which can be very valuable to those using a monoochrome TV or monitor).

And it's sometimes possible to break into commercial programs (you wouldn't, would you?) you might even be able to tag in

What wins extra praise for *The Oracle's Cave* is that the challenges you meet, their solutions and your continuing progress all have a decent logic to them - you don't get struck down at random at the whim of some so-called interactive element. Thus the intelligent games can and does eventually win

The list of desirable British and American adventure games for the Commodore 64 is growing week by week. That reflects not only the growing interest in adventuring but also the 64's eminent suitability both in graphics and 'elephantine' memory for this brain-straining pastime.

In response to sackfuls of requests from avid gamers, the equally avid John Ransley has started a regular Adventure column to let you take time off from wondering colossal caves and dodging axe-wielding hobgoblins. But we'll still be relying on you, the reader, to tell us what you want. And in future columns, we'll try to give an airing to readers' comments, ideas and programming tips. But if you're "stuck in the mauve swamp" or you don't know what to do with the Gimblegook's wand, you'll find no real solace here. Now read on...

GAMES

Read all about it

Maybe it's a little too fundamental for the experienced old-savvy, but *The Adventurer's Notebook* by Mike Gerrard (Duckworth, £3.95) is written with such infectious enthusiasm for the subject that it makes a worthwhile addition to the macro bookshelf, whatever one's level of competence. It actually runs to fewer than forty pages of introductory text. But these present a highly readable run-down of the game's not so ancient history, gaming principles and playing hints.

REPRINTED BY VIDEO GAME

BOOK OF ADVENTURE

The larger part of the book is devoted to ten sets of adventure worksheets, every one of them comprising pages for recording your progress through the adventure, objects found, actions taken, recognised verbs and nouns, and so on. And there's a 105-location map for charting your progress.

You could of course use more than one set for larger adventures involving a greater number of known locations. You might even (though don't tell anyone I said so!) photocopy extra pages yourself - the left-flip spiral binding makes this easy to do. It's certainly an improvement on trying to decipher my previous night's squiggles and squares committed to the back of rat-tail demands and book-clab invocas.

A more substantial volume altogether is Keith Campbell's *Book of Adventures* (Melbourne House, £5.95). Street creditability is en-

hanced with a foreword by Scott Adams, who comes dangerously close to writing something extenuating about puddings - but with Adams, what can you expect?

The usual introductory chapters on the genesis of computer adventures (Crowther and Woods now being as familiar a twosome as Fortnum and Mason, Marks and Spencer or Burgess and MacLean) is followed by a genial scroll through the various stages of creating an adventure, using assembly as an example program with fewer than a dozen locations to keep the baptism simple. But it still manages to incorporate all the main programming ground rules.

You'll learn how to move around the map, site, take and leave objects, introduce special commands and traps, check your inventory, and structure a one-solution finale. All the examples are presented in Basic; that is non machine specific, so Commodore users will have no difficulty in adapting them. The main demonstration adventure, however, is reproduced as an easily-readable customised Listing - one of them for the 84 or Vic.

New releases

sequent visits - although you can call up the graphic again if you want, say, to check for a visual clue. You can enter 'proper' sentences such as 'Give underbox to swamp lizard' (he ate it - which shows you what kind of life Jan Grey must have), or 'Say to Izar, Enter the bow' - but cheats like myself must manage without a dictionary of the adventure's permitted vocabulary.

Heroes of Karm is from Interceptor and comes in a sturdy vinyl wallet with clear and adequate playing instructions at £9.95 on disk, £5.95 on tape.

Up and coming and in the shape at time for Yuletide gaming are a sequel from Interceptor to *Heroes of Karm* and a 64 version of Artic's controversial *Ship of Doom*, then there's *Castle Blackstar* and *Pyramid of the Sun*, both new adventures from CDS. A seasonal tangle with the ice age, *Midwinter* comes from Channel 8 and *Stranded*, a promising graphic adventure featuring a marooned astronaut, from English Software.

And there's more *Storm Warrior*, an arcade quest is being released on T-Kei's new Frost Ranger label. And a new state of the art animated adventure from Melbourne House is making its debut on the 64.

And who'll be the first to rush out an arcade adventure *Ghostbusters* look-alike, now that the movie looks like outgrossing even Steven Spielberg?

Making sweet music

64 synthesiser packages reviewed

by Fred Reid

The Commodore 64 has always been a particularly attractive machine for games programmers, not least because it has such sophisticated and spectacular sound and music capabilities. Those tuneful melodies and weird sound effects that accompany your favourite games are all produced by the 64's diminutive yet powerful SID chip.

But actually using SID unaided can be inordinately difficult, especially since the 64's Basic offers no sound commands. So the easiest way to make your 64 play Beethoven (or make him roll over) is to buy one of the many synthesiser packages now available. Recovered from last month's introduction to synthesisers, Fred Reid has been looking at some synth offerings currently available.

Synth-64

Synth-64 is a program best described as a music and sound synthesiser/composer. It allows you to enter musical notes and symbols in a similar way to writing a Basic program - writing a line, each executed in sequence, each containing a number of instructions.

Various other analogies with language are evident. For example you can set up sub-routines, loops, nested loops and GOTOs, and you can insert new lines between old ones.

But there are several noticeable differences - most importantly the 'look ahead' function. This feature allows the composer to scan through the text, looking for any command that it can execute immediately. This means that you can play up to three notes simultaneously, even if they are not positioned together in the text. Don't worry, the new syntax is not difficult to get to grips with, and the manual explains all.

The envelopes and wave shapes of all three voices can be easily altered, and a whole bank of preset instruments can be set up. The filter and volume controls still affect all three voices but these can be modified as often as you like during a composition by calling a subroutine. Other functions allow you to select the various filter modes, such as resonance, synchronisation, ring modulation, pitch modulation for filter and/or voice. This makes quite complex sounds (and noises) simple to produce.

Composing tunes

For the would-be composer, a complete set of instructions is

available. These allow music to be written for up to three voices, using all the traditional methods. Any of the 24 possible key signatures can be selected at any point in the composition, as can the 240 possible tempo settings. To play a note, you must enter the note value ('A' to 'G'), the octave (1 to 8) and length (1/1 to 1/4).

In addition, lengths can be dotted, notes can be tied, and so on. Rests for each voice can be set in a similar way, and the 'wait' function can provide pauses lasting for seconds. The only things missing, from a composer's point of view, are bar-lines and other accents.

Lastly, a round-up of some of the other facilities on offer. No music program would be complete without some means of starting and retrieving your pieces, and this one has Load and Save commands for tape and disk. A 'tracer' function lets you watch the changes in patch and waveform, as it plays. And the structure of the music-program storage allows for easy editing. The program even lets you include Print commands in your music, and lets you list the music program to a printer - very useful.

Conclusions

Although the manual is generally well written, spelling mistakes abound, the print quality is pretty poor too. As the manual is about 40 A5 pages long and tightly packed (photo-reduced laserwheel printing), an index or quick-reference section would have been nice, not to say essential.

One particularly annoying feature is the three sample

pieces. None of them even came close to the mental image I conjured up from their titles, 'Hallel Hymn of the Republic', 'Polka' and 'Moonlight Sonata'. The program is so constructed, that you have to load the three aforementioned strophes and play one of them before you can get down to your own composition. This is not only unnecessary, but almost doubles loading time.

To run up, this program is limited both by its semi-graphic representation of the music, and by the limitations of the 64 itself, which has only poor dynamic control, and produces background noise from the video circuitry. But all that is compensated by the flexibility that Ultisynth-64 allows. Still, programming a long composition can be a long and tedious affair, but a dedicated effort can produce excellent results.

The Commodore Music Composer

"Are you tone deaf? Do people cringe when you sing or play an instrument? You have just purchased your salvation!" That's the blurb that confronts you on the first page of Commodore's "Music Composer" manual, as if in defiance of all we know to be true. Can the program live up to that bold statement?

Music Composer is cartridge-based, so it loads instantly without you needing to brew a cuppa in the meantime. Powering up invokes a title page with an invitation to press any key. This offer provides you with the main menu; and selecting option 1 from that menu gets you the sample song.

At this point, we notice the main feature of this package; the music scrolls across the screen from right to left, the notes appearing as you hear them. Although the use of smooth scroll graphics is pretty clever, the feature is almost totally useless because musicians (inspiring or otherwise) generally read about two bars ahead of the note being played or listened to.

Each note appears in a different colour according to which voice is playing it, although this feature can be cancelled if not required, and then all the notes appear in black.

A number of preset instruments are provided, and

can be selected from a secondary menu. These instruments include such audio delights as harpsichord and calypso (a kind of steam organ). Later we will discover how to create our own sounds.

Option two from the main menu turns the 64's keyboard into a piano type affair in the normal way and as you play, the notes once again scroll across the screen.

Programming

Programming note sequences, as opposed to just playing, is achieved in a similar, yet less complicated way, to Ultisynth 64. You start with a line number, and follow it with a string of notes, length values, octaves, etc. At any point, you can return to what you have just written, or in the unlikely event of your program overflowing the screen, hit it. In this way, you can edit in a similar fashion to Basic.

No composing system would be complete without a *load/save* option, and in this case, the medium is cassette, the option once again being selected from the main menu.

Under the heading of "Advanced Special Effects", the manual proceeds to describe how to make up your own sounds. Unfortunately, they forgot to allow you to store your sounds for future use!

The manual is slightly larger than 'pocket' sized, and outlines the basic operation of the composer, and briefly explains some of the terminology not common to everyday use. The manual finishes up with a complete and useful guide to what keys do what.

Conclusion

To sum up, a simple little package, with one or two gimmicks but little educational value, and unlikely to remain a treasured part of your collection for long.

Ultisynth 64

Quicksilva, Ultisynth 64's publishers, describes their package as a music processor; perhaps 'sound processor' would better describe Ultisynth's nature.

The package is cassette-based and consequently takes about seven and a half minutes to load. It comes in a large plastic box with a skimpy booklet/manual - more on this later.

On loading, you're presented with a menu for selecting such essential options as *record*, *playback*, *load*, and *save*, amongst others. Selecting *record* produces the main display screen containing information relating to the sounds and notes.

Across the top of the screen is a table containing the ADSR (attack, decay, sustain, release) values and the waveform(s) selected for each voice. Next to this table are four dots arranged in a distorted diamond pattern; the significance of these I have yet to discover.

The lower half of the screen is split down the centre into two halves, containing horizontal bar-charts indicating the frequency of each voice, the tempo of each voice, filter frequency, resonance and others. Control over these functions is obtained by selecting any of the 164 key combinations. That lot makes constant reference to the manual pretty essential.

Playing and composing

In record mode, most of the unshifted keys play notes. And as you play each one, its value is displayed at the centre of the screen while previous values are scrolled left. These values are stored in sequence for later playback. The position of the next note in the sequence can be moved backwards or forwards to enable editing of the all too frequent duff notes you accidentally produce.

Pressing the space bar gets you back to the main menu. Selecting the playback option

takes you back to the previous display, with the only difference being that the notes are played back automatically at a tempo of your choosing (if you can find the correct keys).

In *compose* mode, you enter notes via a vertical bar chart that scrolls to the left as you set each note. Thus I found particularly frustrating, as you can't hear what you are doing.

While in *record* or *playback* mode, you are offered a choice of six preset accompaniments for each of the other two voices, as well as a couple of user-defined options. These can be put to use by manipulating blocks of notes in memory using option 6 (*transfer notes*) from the main menu.

A facility to synchronise the start of all three parts is provided, but this does not guarantee they will commence at the same speed! This, along with the difficulties in remembering what key does what, makes the whole system very clumsy indeed!

As you'd expect, Ultisynth contains *load* and *save* options for cassettes and disk. One slight problem here is if a disk error occurs while loading or saving a music file, like you forgot to close the drive door, the whole program crashes and you are faced with the daunting prospect of re-loading (seven and a half minutes), and worse - re-writing

Documentation

The manual is approximately pocket-sized, and contains about 50 pages, including reference sheets to detect (and lose!) a brief glide to sound and synthesise, and a fair coverage of the essential features of the program. Also included is a Basic program listing to allow the inclusion of music created on Ultisynth into your own games. The manual has a detailed Contents page, allowing easy access to the interior, providing you know what you are looking for.

Conclusion

In my view, the whole idea of a program such as Ultisynth is to make the immense capabilities of the 64's SID chip easily accessible to the average 64 owner. Ultisynth attempts this but falls a long way short of being 'user friendly'.

Multisound Synthesiser

Multisound is yet another cassette-based synth package for the £49.95 price from Romik. The cassette arrives in an over-sized plastic wallet together with a pocket-sized 24-page manual - more on the later.

Loading Multisound takes an tolerable ten and a half minutes. You're finally presented with a control screen labelled 'Special effects panel'. This panel contains information relating to Voice 3 and allows you to produce special effects such as staccato etc.

Pressing 'U' toggles between the special effects panel and the main control screen. The main screen consists of rows of pseudo faders, operated by pressing the key named next to it. This system is one that I wholly approve of, as it resembles a 'real' synth control panel.

The main control panel contains only controls for one voice, namely Voice 1, the voice you are going to play with Voice 2 is used exclusively for background tunes or rhythms, and are set up from the same control panel as Voice 1.

Playing modes

Various playing modes can be selected from the main control

panel. Pressing 'F' gives you a piano-type keyboard on the screen. Pressing a designated key plays that particular note, and the corresponding piano key changes colour.

Pressing 'A' also gives you the piano type keyboard, but this time the computer records everything you play. Other facilities allow you to continue where you left off after visiting the main control panel, perhaps to change the sound slightly, or make use of Multisound's auto-space function. In this mode, the computer automatically spaces the notes out evenly at a tempo set from the special effects panel.

Of course, being able to record tunes is no good without

being able to play them back. Playback mode 1 allows you to listen to what you've just recorded, and to alter the parameters from the main control panel while you hear the results. Playback mode 2 is identical to mode 1, but allows you to control the overall tempo with the '<' and '>' keys.

The background generator, as previously mentioned, can be used to store short repetitive tunes or drum patterns, or alternatively, use one of eight pre-programmed patterns. These can then be played back while you record over them with Voice 1.

A useful addition to the expected load/save routines is the merge function. This allows

you to load a tune from tape, and append it to the tune in memory. Using this technique, a long tune can be written in short sections, stored on tape and then brought together.

The manual

The manual is a stiff-backed booklet, arranged in seven chapters. The first chapter gives a brief introduction to Multisound, and a description of some of the terms used later on in the manual. Chapters two and three give a brief introduction to synthesis techniques and the nature of sound. Chapters four to seven describe in detail the Multisound system, and how to use it. Two appendices describe how to set up certain sounds, while a third gives suggestions for further reading. In short, the manual is everything a manual should be, and, being short, it is very easy to find the bit you want.

Conclusion

To sum up, Multisound is professionally packaged, and easy to use. The facilities offered are rather slim, but there is nothing noticeable missing - other than a turbo loader!

Vicar would

...well I must close now Mary because the
borrow my Wordcraft 64.

Best wishes, see you soon.

Wendy

P.S. I sometimes wonder how I used to find the time to write before Bob bought his Wordcraft 64.

He uses it to write articles before giving them to his Editor.

Paul uses it to prepare his university project reports.

John, from next door, borrows it to type the golf club reports, and the Vicars getting quite impatient, he uses it for the parish magazine.

Thank you Wordcraft 64 for making so many friends for me.

Wordcraft 64 costs only £49.95 inc. VAT and is available from all good computer retailers or direct from ourselves.

The £4 ought to be an excellent computer game - and fortunately some suppliers are indeed taking advantage of that. Others aren't. Here's this month's crop of reviews.

How do we assess games? Basically we play them - which may sound obvious, except that all the reviewers have seen so many games that they can apply a bit of comparative experience to the evaluation.

We rate games out of five for each of four criteria. **Presentation** means how well the thing is packaged and how good it looks on the screen: dull graphics and poor sound get marked down here. **Skill level** refers to how much skill (of whatever kind) is required to play the game - so if pure chance is involved, the game gets a low mark. (But don't dismiss it on that: some 'chance' games are great fun.) **Interest** is an answer to how well the game did at maintaining the reviewer's interest in it. And **Value for Money** is obvious enough: it's our overall conclusion about how it compares with other games and whether we'd buy it ourselves.

BIZY BEEZZzz

Joystick or keyboard
Price £7.95

For Tiddly is lost in the forest after the way to the nearby honey hole. He has discovered a beehive full of honey and as he is beginning to feel rather hungry, you have to guide him through the 10 screens of ladders, ladders and moving platforms to empty the honeypots.

Unfortunately bees don't take kindly to tiddly bears invading their hives and making off with their honey and are therefore very prone to sting if you can't move Tiddly quickly enough. Very fast moving with good graphics and an excellent selection of tunes.

Blue Thunder

CHUCKIE EGG

Joystick or keyboard
Price £7.99

The chief delight of this ladder/plane/platform conundrum lies in simply reaching out-of-the-way places in search of the corn and eggs needed to reach the next screen, whilst cocking a snook at the prowling ducklings. However adept you become at coasting through the eight screens, when big Ma duck breaks free on level nine it's time for a re-think on the soundness of your tactics.

Delicate hops, fast jumps and evasive actions are very much the order of the day. Definitely for the platform-jumper enthusiast, as the graphics and sound can only be construed as adequate; but for stayers of the course the 206 jewels

(I asked A&F about that as I don't have the next two years free) probably a soft challenge.

Apart from being pecked to death it is very possible to come to grief by falling down a lift shaft - oh yes! Lifts are an essential ingredient and add to the fun/frustrations.

I'm afraid there seems to be a fly in the ointment... it doesn't seem possible to skip some of the early levels which of course can lead to the "oh no!" back to the start again" syndrome. So keep gaining points to earn extra lives. A quick-load system boosts the presentation mark.

SHOOTER

SPACE MISSION

ELIMINATOR

James

be nipples become. When sufficient fuel is on board it's time to select the apparently extremely fragile objects raining down from the sky, all riding-out the one defensive system, until the gas goes too hot and disengagement becomes a departure for pasture.

The pattern is frequently punctuated by an unusual phase briefly, you need to match one set of co-ordinates with another then move to the first value. The catch is that the numbers are increased/decreased by using a different random-number control each time. Naturally a life depends on completing the exercises within a given time.

Twelve levels (you may skip the last seven) should provide challenge enough for any budding babbler. Very colourful, but little in the way of spectacular graphics and sound. LS

DICKY'S DIAMONDS

Joystick or keyboard
Price £6.99

We have a deceptively hard teaser we're confronted around a spider's web. Being a remarkably small owl you find it easy to run along the strands of silk, eliminating them as you go, until the whole web is destroyed. But you can fly from one section to another should there be no connecting thread left intact. It's about you do that? Cos the spider has kicked your diamonds and bags one on display slapping in the middle of his silken net unravelling it is the only way to remove the jewels.

The spider, unfortunately, does not make running repairs, that could well be a sign of faulty varnish in my part I managed to succeed and flew off with one diamond, many more left, as always, with no spiders to contend with later in the game.

The last thread to be removed will be a central one otherwise there's just a spectacular structural collapse but no gem stones.

Plenty of options to mull over, including level, unlimited lives (or just the total allowed for the current screen), second player, plus the ability to save the

high score to tape. Fair sonics including flapping wings and a title-theme with a couple of neat visual effects. LS

DICKY'S DIAMONDS

FOR THE COMMODORE 64

A REAL ACTION SHOT OF THE GAME

FELIX IN THE FACTORY

Joystick only
Price £6.99

The tried and tested ladder/maze features once again. Indeed there is nothing original in the program, but like all good recipes, the ingredients have been well chosen and skilfully blended to present an appealing offering which will have you clamouring for second helpings. The man-of-the-moment is faced with the task of toppling-up a generator with oil. True to form the oil-can is anywhere but in a convenient position, so it's a dash along the conveyor belt, jumping over parcels and up the ladders to the upper floors of the factory.

Gremlins (up to three species) are on the prowl presenting you with the choice of evasion or trying your luck at impaling them with a pitchfork. The odd, squeaking super-rat tends to dash across any floor at random necessitating a perfectly timed jump; you may even poison him for a bonus. Failure to stoke the generator within the allotted time costs a life as does carelessly bumping into a monster. But tumbling over a parcel merely deprives you of the oil-can you might be carrying, plus precious time.

As far as I can see there is just one screen, although success allows us further supplies of means to provide variation. The author has succeeded in producing a challenging game. Should you require only one example of the ladder/maze action then a good version of Kong will provide greater depth. LS

GYROPOD

Joystick only
Price £6.99

A two-screen cosmic-combat pan-basher featuring a novel depiction of a space ship. The game opens with a module (you're module) docking with a doughnut-shaped mother ship, which is shown in three-quarter view perspective. By now you have taken control of the huge, double-barrelled gun turret which can be swivelled all around the outer circumference of the ring.

Thanks to the magic of sprays you can see the position of your blaster even when on the reverse side of the battle ship's rim. To annihilate the incoming, gyrating UFOs fire will have to be directed from all sides of the silver craft.

Run out of ammo? Or perhaps the shields are weakening? If so catapult down to the nearby planet (the same one that's due for the chop), taking care to ease-up and land gently; grab some supplies whilst warding off the aliens with your sun pistol, then hop back in and blast off.

When all the UFOs have been dispatched and their planet is warped into eternity, it's time to recruit another civilisation with their own ideas as to how space ships should be designed. So it continues through four waves of alternating mass devastation and hand-to-hand confrontations.

Strong on sound, as it seems everything from Taskset is going to be, with the pictorial side showing flair and imagination. LS

challenges then this could be your red-letter day. Don't be fooled by the entrance hall, enter any one of the eight doors and you face such obstacles as cannon balls, disappearing floors, pounding pistons, monsters and various other bizarre, highly improbable obstacles. This is the stuff that joystick acrobats thrive on.

On the impressive title screen you arrive at the creepy mansion and climb the stairs to the door! I couldn't understand the relevance of the particular accompanying music, but what the heck? If you ever manage to wade your way through the eight rooms packed with seemingly insurmountable hurdles, the door to the treasure chamber is opened to you, to be followed by revelations as to the meaning of life, or something similar. Honest, it's really tough... well... extra tough. And the faint-hearted shouldn't touch it with a barge pole. LS

MR DIG
Joystick or keyboard
Price £8.00

This is (unfortunately) very similar to Pac-Man in its somewhat basic approach. Mr Dig must dig for certain food supplies in the Meameus territory below ground. As he digs he can eat his way round cherry groves whilst being followed and attacked by the Meameus which can be crushed by dropping apples on them. Meameus can't dug tunnels or eat cherries, but watch out as they don't change into miners, which

MICRODEAL

ICE HUNTER
Joystick or keyboard
Price £8.95

Another last loading program - the software companies are really getting the idea now. Thorak, Prince of Ice, has made his way into the multi-level cave. Now all he has to do is collect the blocks of ice necessary to build a very special igloo. However, the path of igloo-building is not that straightforward and Thorak has to fight off some very strange creatures, the first of which is a dragon-like beast wandering about the first three levels. Kill it either by dropping a block of ice on its head, or when the occasion arises, and after sailing a power pull by crushing a thunderfoot.

Thorak can drop his ice blocks through patches of thin ice which will only bear his weight once, to move from level to level he must use the support pillars. Once he has travelled from the kingdom of the dragons he reaches the long dom of the strange mutant sea-hon species, and he cannot go back to collect any blocks left behind or to escape the sea-hon.

Finally Thorak (no doubt exhausted by now - I certainly was!) has to float the blocks down-

can on both. Every so often a fallen apple will split open and reveal a sparkling diamond - collecting this increases your score immensely.

Also introduced into the game are mallets (mallets!) and a letter monster. You can destroy the mallets individually, when they will release two apples, or they will reappear when the letter monster is destroyed. You can destroy opponents either by launching your power orb or by dropping apples on them!

There are also levels of play from Baby to Macbeth, so there should be a level to suit most people. WG/PR

NURSERY NIGHTMARE
Joystick only
Price £7.50

Not a blockbuster but an extremely enjoyable, simple game with five levels of genuine increasing difficulty - the situation changes, not just the tempo. Everything revolves around your attempts to keep your offspring bloated with milk. The screen is divided into three lanes separated by green lines; you, the harassed husband, may cross them with impunity. But if you attempt to take baby with you, on storms the apple of your eye to bonk you on the head. She will also appear if you drop your infant on the floor or

fail to return with the milk in time.

You will need to carry the baby to the top of the screen, release it, zoom across to pick up a bottle then backtrack in time to catch the infant who is tumbling toward the foot of the screen. No time to lost

as the countdown has run out, back to the top and make for the next bottle.

Level two sees the milk moving as well as the toys while the serial of skill forces you to cross the lane; it's just like running across the M1 and back again. Obviously running, anticipation and sharp reflexes are needed. Nothing special about the graphics but the sound, which just complements the action. Refreshingly uncomplicated entertainment.

ORC ATTACK

Joystick only

Price £17.95

The Orcs are coming! They are scaling the castle walls and trying to stab at you with their murderous daggers. A crossbow bolt slips past your left ear - but are you afraid? No! You are Sir Eric the Brave, while Orcs will not get the better of you.

Armed with rocks, boiling oil (very nasty!) and your trusty sword, you must fight the Orc until the last one is dead. But even then the castle is not safe - the evil Sorcerer appears and commands his spirits to attack you. You may survive and stay bare, but now he dressed Stone Wizards are after you. It's a never-ending task, defending a castle these days!

Fair sound and good graphics make an enjoyable game, though the picture on the package frightened the cat! And they ask if you want a free poster version of it as well... WOFR

SCREEN ONE

TYPING WIZARD

Keyboard only
Price £3.50

Although not a game, we've decided to include Typing Wizard just as somebody somewhere may conclude typing is fun.

Have you ever been ashamed to put your two fingers to the keyboard, having witnessed a dozen fail at ten-fingered touch typing? Well, how help is at hand - you can improve your typing prowess in secret, using this patient tutor from Seven Software. In a series of lessons, ranging from the home keys to the whole keyboard, you are shown a graphic keyboard, with your fingers resting where they should be. You must type exercises exactly as shown on the screen; the computer keeps and rejects any wrong keys. The lessons are single letters followed by groups of letters. At the end you are told how many errors you made, and your average typing speed. Also included is a speed test - you simply choose your own text, and type away. The 'Copy what you see' exercises will also help keep your eyes away from the keyboard, a good discipline.

The niggling point, though the program uses F7 as its Continue key, which can be awkward when you're at the start of a lesson, setting up your fingers as instructed. Having just arranged your fingers correctly you must then remove your hand and press F7 to continue... Nevertheless, the program should prove useful to those of you who need to become proficient typists.

VALHALLA

Keyboard only
Price £14.95

At last, Legion has released Valhalla for the 64. I say at last, because it made Game of the Year on the Spectrum. But that new version not only equals, but improves upon the original. Apart from running faster on the 64, the characters are now in colour - and there is a 'mono' command for those with monochrome monitors and TVs, which selects a more limited, but easier to see, colour scheme.

For those who don't know what all the fuss is about, I shall attempt the impossible, in describing Valhalla in one paragraph. It's a real-time adventure game in which the players must find magical objects. As you roam through the graphically depicted locations, you can gather food, weapons, armour and other such items along the way, which are vital to your survival. The player and any other characters nearby are presented by little animated figures which move, fight, eat, drink and generally act out the adventure as described by the text.

As the game is in real-time, even if you didn't do anything, the other characters aren't idle, and will come and go as they please, often fighting amongst themselves - and with you, depending on their opinion of you. One thing about the 'animation' taking place all around you is that you may actually have to wait a while before the computer processes your command as you must wait for events such as fights and deaths to end. As the player is depicted on the screen, it is possible to move left and right - to reach a bottle of wine, for instance - and not just the normal N-S-E-W of other adventures. If you issue a command such as 'Get Sword', you will see the player-character do just that on screen.

I have only scratched the surface of the complexities of Valhalla. I could write a book just describing it - indeed, the instructions provided with it are themselves on the meany side. The what-you-see-is-what-you-get approach to the accompanying graphics is an interesting approach (they call it MOVISOF).

In conclusion, I hardly have to add that this is a complex, well thought-out adventure, which will keep the most intrepid of adventurers amused for many hours of good adventuring. Happy Adventuring!!! Legend

Commodore Français – frenchify your Vic or 64

by George Pilkington

Fed up with boring old French texts? This seems like a good job to sub-contract to the computer. English is no problem; but what do you do about those tricky French accents? One way would be to chicken out and work entirely in capital letters. No accents required then, but that's hardly helpful.

Once you've discovered user defined graphics, it's easy enough to design the accents and put them into the computer. So then the question is how to get them in the right place and get rid of them from the wrong place. And wouldn't it be nice to put them on the function keys - four keys for three accents and the cedilla?

Two Tommy came to the rescue, he gave me the idea of using GET statements to feed words into the computer rather than INPUT. The disadvantage is that there is no flashing cursor. The advantage is that each letter and string is put in and stored separately and the word built up after RETURN has been hit. Access strings consisting of the defined graphic and necessary cursor controls can then be assigned to the function keys by a set of four lines, for example IF X = CCHR\$(33) THEN RX := AS : AS being one of the four accent strings.

Before starting on the program itself, here are some practical points.

Some points for victims

The programs only work with the unexpanded Vic or with either 3K expansion or the Super Expander. The actual *RescueDisk* uses up most of the unexpanded Vic so one of these cartridges is virtually essential for a practical program.

With the Super Expander, either assign the strings to other keys or disable the function keys before starting to LOAD or program. To disable the keys, type in **STS#450: POKE 541.0:** **POKE 642.4:** **POKE 643.0:** **POKE 644.10:** **POKE 645.30:** **STS 6424** and **RETURN**. Again, thanks to Tommy. The screen changes to show **8550 BYTES FREE** and the function keys are all active.

If you're going to use the Programmer's Aid Cartridge, the function keys are a pain. Assign the strings to other keys. To do this, simply alter the **CHR\$** numbers. The values for each key are on the user's manuals. They can be assigned back to the function keys immediately before the program is **SAVED**.

The 64 Screen

What maniac chose the colours of the 64 switch-on screen I do not know Line 100 is simply to make the text legible. Please yourself.

And remember, SAVE before you RUN user defined programs Once Stage Two is working, it is time to add the user defined accounts, that is the 200+ and 300+ blocks. SAVE before you do this and SAVE again before you RUN the program. One error in the 200's can crash the 84 and all that has gone before is lost - most annoying.

Allons-y

Do not be alarmed by four listings. They follow on from each other, building the final program up in stages to demonstrate the routines used. By leaving the 'real' accents to a later stage, a lot of time is saved when MUNZING to test and explore intermediate stages.

Stage One: just follow the program listing. The M in line 330 is not needed yet but it is safer to include it now. As each

Maps of France: Britain's nearest neighbour in Europe

Stage One listing

-Victuals

letter is fed in at line 310 the letter count is advanced by one. The DELete key functions normally and RETURN is used to signal that the word is complete.

So far just like INPUT without the flashing cursor. But with one exception, the word is not yet built up. That is done in line 980. The first word is WS(0), the second WS(1) and so on. LS and WS must be DIMensioned in line 400 up to the maximum number of letters in a word and the maximum number of words to be fed in.

Type the program in and RUN it. Not sensational but a start. The computer should ask you to type in your word. Do this and when it is correct hit RETURN. There should then be a list of words typed in so far and an invitation to press a key to add to the list.

Eventually the program will operate in 'Typewriter' mode. This means that any letters that are finally to appear as capitals must from the beginning be typed in as SHIFTed characters. Looks a bit odd at this stage, but so what?

Stage Two: now we come to the important bit, the accents. Or, at this stage 'sort-of' accents. But never fear accents they will be in due course.

Stage Two is simply Stage One with some lines added. Type in the extra lines and amend line 910. Lines 90, 905 and 910 can be removed now. Lines 410-460 contain the accent and accent delete strings. The accents are going to be on Commodore-shifted X, C, V and B and for now those graphics symbols will be used as accents.

Accents don't need to be printed an extra space out. In fact one of the things an accent string does is to pull the character back a space. We must then count two things separately, the number of letters and accents and how far out to print. **N** counts how many and **M** how far.

The program works very much as Stage One except that the function keys put strange graphics above or below letters. Have faith, they will be accents soon. Press the function key after the letter which the accent or cedilla is to go over or under.

Once this stage is working, it is time to **SAVE** the program. Now to business, the computer is to be Freshuffed.

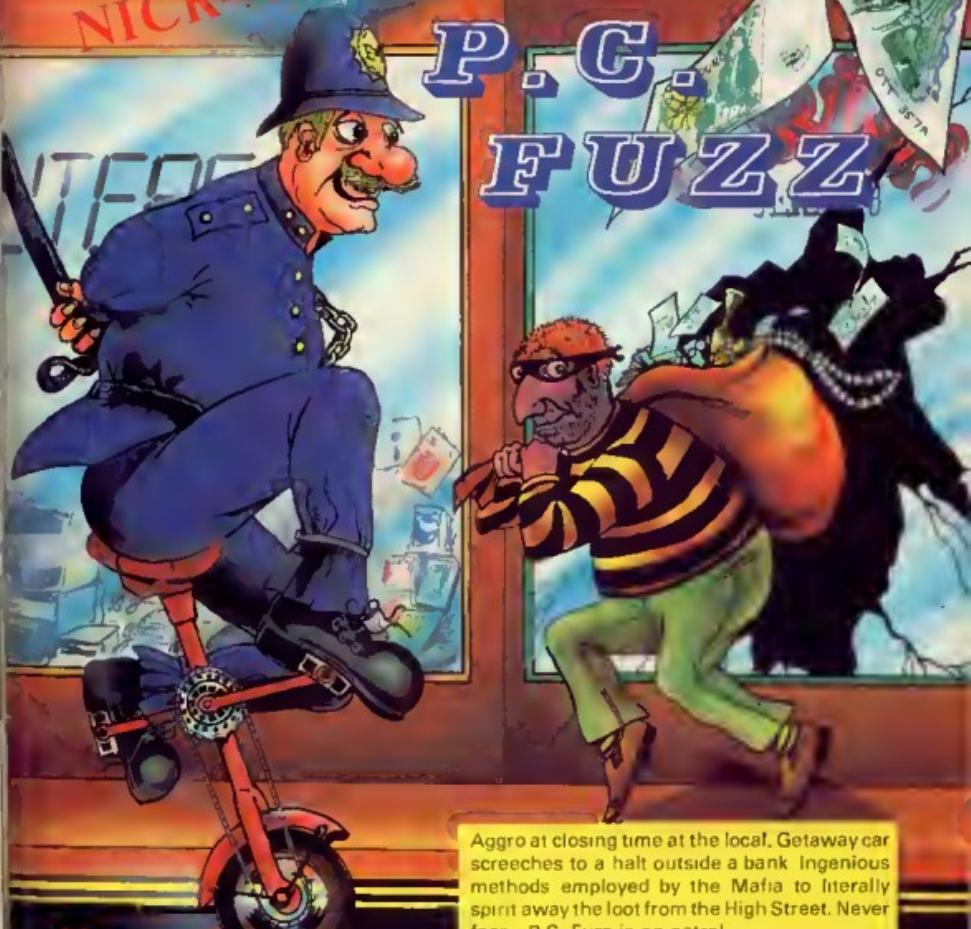

Stage Two listing

Vietnam

Stage Three: the principle listing is for the 84. For the Vic replacement lines are given for lines 290-310. The DATA lines are the same for both computers. Type in the extra lines and SAVE. With the 84 one error in the 290's and 300's can crash the computer and lose the lot.

In the 200- and 300-blocks, user-defined graphics create the three accents and cedilla and PEEK and POKE the "typewriter" keyboard from ROM to RAM.

Finally RUN the program. Chade will appear on the 84 screen and slowly bring itself to order. If there are no mistakes you will shortly be invited to Type in your Word! Accents are now accents. The computer is in Typewriter mode, spaces have become A's and hearts S's, SHIFT produces capital letters. Your computer is Frenchified at last.

The Final Stage

French Word is not particularly useful except to show how the computer can be Frenchified. The most useful programs work in pairs of words **E\$1**, **F\$1**, ... These are put into the computer and when all the strings have been entered the **E\$**'s are displayed one by one and the French demanded. The entry is then compared to the appropriate **F\$**.

So now we must type in our words in pairs. First we must tell the computer how many pairs there will be and DIMension enough strings to accept them, lines 470 and 480. Because we might re-run the program with a new longer list and need to Clear and reDIMension, all DIM statements should now be moved to line 480. Remove line 400 to avoid a **KEDIMENTION ERROR**.

Line 490 sets up a loop to take in the word pairs. Lines 550 and 800 take them in and when this is finished, line 610 sends us off for a bust on them.

To print our entry words on different lines and make two sets of word strings calls for some changes to the \$80 and \$90 blocks. Thus line \$90 becomes

800 W3--N=1,M=1

We need an empty word string in which to build our word. The contents of **WS** are transferred to the string to be stored once the program has RETURNed.

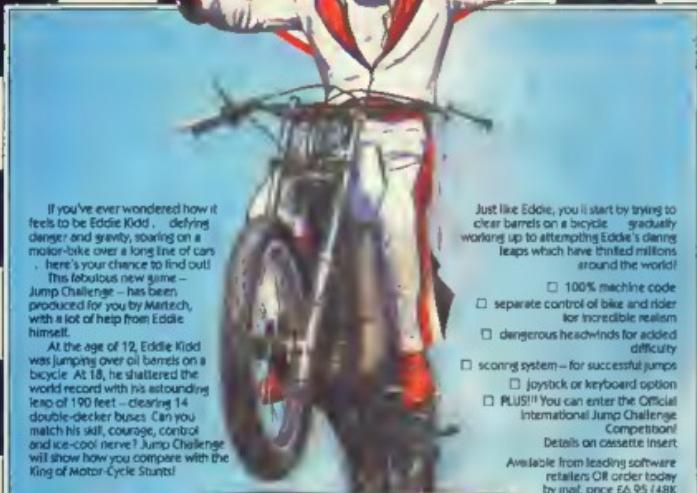

Viceregal Government Lines for Stage 3

1980-1981, $\Delta_{\text{H}_2\text{O}} = -0.0001 \text{ psu}$, $\Delta T = 0.001^\circ\text{C}$

THE OFFICIAL

Eddie Kidd JUMP CHALLENGE

If you've ever wondered how it feels to be Eddie Kidd... defying danger and gravity, soaring on a motor-bike over a long line of cars... here's your chance to find out!

This fabulous new game - Jump Challenge - has been produced for you by Martech, with a lot of help from Eddie himself.

At the age of 12, Eddie Kidd was jumping over oil barrels on a bicycle. At 18, he shattered the world record with his astounding leap of 190 feet - clearing 14 double-decker buses! Can you match his skill, courage, control and ice-cool nerve? Jump Challenge will show how you compare with the King of Motor-Cycle Stunts!

Just like Eddie, you'll start by trying to clear barrels on a bicycle... gradually working up to attempting Eddie's daring leaps which have thrilled millions around the world!

- 100% machine code
- separate control of bike and rider for incredible realism
- dangerous headwinds for added difficulty
- scoring system - for successful jumps
- joystick or keyboard option
- PLUS!!! You can enter the Official International Jump Challenge Competition!

**CASSETTE £9.95
DISK £14.95**

THE ULTIMATE IN AMERICAN SOFTWARE FOR YOU ON U.S. GOLD
U.S. Gold is stocked by all leading computer stores including:

John Menzies

WHSMITH WILDINGS WOOLWORTH

Line 910 becomes two lines

```

905 PRINT (HOM)
910 FOR PD = 1 TO P:
    PRINT"(CUD)": NEXT PD:
    PRINT SPC(M+2)LS(N)

```

Finally the 960 becomes:

```

380 FOR D = 1 TO N-1:
    WS=WS+LS(D):NEXT D:
    RETURN

```

The word pairs are now installed. Now for the test. **Line 610** has sent us on our way. Lines **1000** to **1040** are no longer needed. Lines **2000** to **2110** are the test. **2010** chooses the pair for each question. **2020** and **2030** make sure we haven't had that pair before. Each pair then is included once and only once in random order. Lines **3000** to the end give simple options to end, restart or start a new test.

This is simply a skeleton for a French test. One obvious area for development is in responding to wrong answers. There are all sorts of possibilities to include times, scoring how many right first time, keep a record of the best time and name the current champion (watch CLR and DIM for that one). It all makes good use of the computer and may even lighten your chores. Bon chance.

Virtual

Keybeep

by Fred Reid

This program produces an audible bleep from your TV whenever you press a key on your Commodore 64. This is particularly useful when copying software from magazines; you don't have to look at the screen to verify that you actually pressed a key. As each key produces a different tone, you can soon get to recognise a wrong keystroke.

The routine runs entirely in machine code, and is located at \$C000 (49162 decimal), and occupies only 120 bytes - so it's small enough to insert into your own programs.

The machine code program is split into two parts. The first part is used to set up the SID chip, and change the interrupt vectors to point to the second routine at \$C057. The second routine examines the current key being pressed, and uses its ASCII value to provide the pitch information for the SID chip. If a key is being pressed, the Gate bit (3D404) is flipped on, then off, to start the note. The routine then jumps to where the interrupt vector originally pointed to (before the first routine altered it), and the computer continues as if nothing had happened.

When run, the Basic loader reads the DATA statements, and POKEs them into RAM. When this is done, the initialising routine is called by **SYS49152**, and the Basic loader is NEWed. At this point the beep can be enabled by pressing F1. Pressing F1 will turn off the beep. If you press RUN/STOP and RESTORE, the routine will have to be reinitialised (**SYS49152**) before it will work again.

Print cassette tape covers

by Albert van Aardt

One of the handiest applications I have found for my 64 and the printer is to print covers for my cassette tapes. As I have a few tapes (over a hundred, in fact), I decided to write a program to produce neat covers for them.

It just so happens that the 4x25 line screen is exactly the size of a cassette cover when printed on my Seijscha 100VC (aka Commodore 128). How's that for unplanned standardisation? Of course, the program can be adapted to format, change and print any screen.

Lines 100 to 300 give the basic layout - you can change it to suit your own ideas. The POKE3023,125 in line 300 is merely to place a "J" symbol in the bottom right hand corner so as to avoid the line feed of PRINTing it.

Lines 10 to 15 are the 'cursor' routine. The current position is PEEKed and the character is stored in C, then a block is POKEd in the same position followed again by the character. This causes the cursor to flicker.

Lines 22 to 40 check the cursor controls, lines 60 to 80 put the character entered on to the screen. Line 21 checks to see if F1 was pressed; if so, control is passed to subroutine 10000 to print the screen.

I have found it very handy and neat to have all my tapes with uniform covers. If any changes, I simply run the program again and type in the newnames.

Just one other thing: no provision has been made for Insert and Delete - you have to re-type the whole line if you made a mistake. This is not as bad as it sounds, because it is, at the most, only 40 characters.

```

Introducing

MusiCalc™

The Creative Music System

MAKE MUSIC PLAY

On Your Commodore 64®

Put the MusiCalc™ diskette into your Commodore 64. Sit down. And brace yourself!

You're about to discover an entirely new way to make music. With MusiCalc, the creative music system that makes music play. Almost instantly, the whole family will be able to create and perform all kinds of music. From rock 'n' roll to technopop, from classical to country western.

MusiCalc makes music more fun, more rewarding and easier than it's ever been before.

NOTEWORTHY SOFTWARE

MusiCalc software turns your Commodore 64 computer with disk drive into a sophisticated musical instrument. And it turns you into a computer performer and conductor.

MusiCalc's Synthesizer & Sequencer is the heart of the system. With it,

you can use your computer keyboard to program the tempo, key

and style of music you want, and also to play your favorite tune. The computer screen will show you what the music is doing as you play and how to control it.

Start by selecting one of MusiCalc's preset scores. Try combining that with a preset sound you like. Choose the scale you want to play in—anything from jazz to Japanese.

Presto! You've got music.

Exercise your musical creativity by putting the three voices together any way you want, and playing what ever parts you'd like. Make changes and add special flourishes to create your own compositions.

Even a musical novice will sound good right away. And the greater your musical talent, the more challenging and exciting MusiCalc becomes.

BACH TO BASICS

Although simple to learn, MusiCalc was designed to meet the needs of professional musicians

In fact, it delivers the quality and capabilities professionals have spent thousands of dollars for—up until now. Once you have the Commodore 64 computer and disk drive, you can get started for under \$100 with the **MusiCalc™ Synthesizer & Sequencer**.

This is a stand-alone software program you'll never outgrow. And with the variety of other MusiCalc products currently available, plus the many more items Waveform will be introducing in the months ahead, you can expand your music system along with your interest and ability.

THE MUSICALC SYSTEM

MusiCalc includes a full line of software that brings great music as close as the keypad of your Commodore 64. **MUSICALC I, Synthesizer & Sequencer** turns the Commodore 64 into a sophisticated musical instrument—a three voice synthesizer and fully-interactive step sequencer. Play along with a song or write your own. Develop your own instrument sounds. And record the music you create.

MUSICALC 2, Score Writer™ Works with the Synthesizer & Sequencer to change your musical improvisations into musical notation. With the addition of an optional graphics printer you can turn your

own original compositions into sheet music. Requires MusiCalc 1 to operate.

MUSICALC 3, Key board Maker™ enables you to create your own custom musical keyboards. Comes with over 30 preset keyboard scales from around the world - even vibing from classical to rock. Requires MusiCalc 1 to operate.

MUSICALC TEMPLATE 1, African and Latin Rhythms Add this to the MusiCalc 1 system and it provides additional musical scores and patches you can play along with or use to develop your own compositions. Requires MusiCalc 1 to operate.

MUSICALC TEMPLATE 2, New Wave and Rock Works like Template 1 and features the latest Technopop scores and sounds. Requires MusiCalc 1 to operate.

MUSICALC

PROFESSIONAL SYSTEM

The MusiCalc Synthesizer & Sequencer, ScoreWriter, and Keyboard Maker, plus the two Templates, in one cost-saving package.

HIT DISKS Recordings to play on your computer. Original Technopop compositions, current hits and old standards performed by the Waveform Band. Ask your dealer about current releases.

COMING SOON: MusiCalc UK is already working on all British additions to the family. Like more Templates for rock, jazz, funk, disco... the Drumulator drum rhythm Template (play along with your own melody)... the MIDI interface to link you 64 and MusiCalc to a synthesizer... a choice of real piano-style keyboards (target price a maximum of £90!)... and the cartridge MusiCalc should be available for Christmas!

DEMO DISK An entertaining and informative demonstration of the capabilities, features and uses of the entire MusiCalc System. Also available in tape cassette.

MAKE MUSIC PLAY

MusiCalc will make music come alive for the entire family. It's a fun and educational way to introduce your children to music and computers. And no matter what your background, you'll find yourself playing and understanding music in an exciting new way.

Buy direct from us, or ask your computer or music dealer about MusiCalc. Or send £5 for the MusiCalc Demo Disk. Discover MusiCalc, the creative music system.

• MAY WICO BE WITH YOU •

When you're up against all the evil in the universe, you need the finest joystick. Weak, sticky, slow controls can only lead you to your doom.

You need a Wico®. The controls in more than 500 modern arcade games are actually made by Wico®. They set the industry standard for durability and performance. And the same arcade quality goes into the Wico® you take home.

Wico® joysticks work directly with the Commodore 64™, Vic 20™, all Atari® Home Computers and Alan® Video Games.

Add an interface, and you can connect into a Sinclair Spectrum or Apple II™ and III™. If you have a new MSX computer there's the just-released MSX Grip Handle for you.

What do you get? A man-sized handle on a virtually unbreakable shaft. Tough, ultra-sensitive Wico® switchgear. A heavy-weight base. A year's guarantee. And more sheer

dodging, chasing and blasting power than ever before.

The Wico® range includes the famous Red Ball™ straight out of the arcades. The Three Way Deluxe with interchangeable handles. The light but rugged Boss. And check out the state-of-the-art Trackball™—many owners use it for serious programming, where it gives them effortless cursor control.

Ask your dealer to let you handle a Wico®. Quality (you'll find) costs money.

But if you want to have less trouble fighting the forces of darkness...only Wico® is worthy of your hand.

WICO®

THE FINEST HAND CONTROLS
IN THE KNOWN UNIVERSE

Database flies on to disk

Micro Magpie reviewed

by Karl Dallas

The Magpie database for the Commodore 64 was originally written as a cartridge-based program, and very powerful it was too. Not cheap of course, but still worth the money – even at just 5p under £100.

Now Magpie's supplier, Audiogenic, has released a version of Magpie on disk. Called Micro Magpie, it costs just £39.95 which makes it probably the best value database on the market. Karl Dallas has been putting it through its paces.

The advantage of cartridges, of course, is speed and if the disk version of Magpie had to constantly access disk the money saving would be more than offset by the loss in convenience. But the program (16K of it) is held entirely in memory and after it has been LOADed (taking about 45 seconds) it is no slower in operation than the cartridge version.

If you're the sort of person who's anxious to get to work that you can spare that much time, then it's probably worth £50 to you to get the cartridge, but otherwise I can see the disk version of Magpie sweeping all before it.

Despite the "Micro" label which might suggest some kind of diminutive, the new version is actually more powerful than the original, especially in the search parameters.

Basics

Magpie is entirely menu-based, which is great for the beginner, because all the available options are made available to you every time you want to make a choice. You even use menus to employ the "procedures", or programming language, which allows the user to personalise the way a database is used, and make it even easier for the non-technical assistant or secretary to access.

The drawback of menus helps screens and other user-friendly dances, is that as you get into the way they work, you no longer need so much help, and the program becomes rather like a kind of fuzzy idiot, always at your shoulder being more helpful than you need.

The more sophisticated programs will offer you different levels of help as you progress in experience, so that you can avoid its syndrome but it would be un-

reasonable to expect a £40 program to be that flexible.

There are a total of 23 menus which are arranged on a tree structure from the opening five-option menu.

In addition to its work as a database, Magpie contains no less graphing capabilities, either from typed in data or by taking data from files. And it comes with two sample programs: a simple mailing list (which for obvious reasons all databases usually take as an example), and a more complex stock control application, including the processing of invoices, purchase orders and credit notes.

Setting up

The program is LOADed in the normal way by typing

LOAD "MAGPIE"

which LOADs and RUNs the leader, and consequently the main program file. A title page is displayed during the LOAD, and the user is asked if a single 1541 disk drive is used (no) or the program assumes daisy chained 1541s, allocated device B and device 9, though it can access the more powerful (eg 4050, 8050, 8250) business double drives via an Interpod. But the use of IEEE cards in the cartridge slot is advised against, because they use some of the available memory.

Then the user is asked if a serial printer is to be used ('no' assumes a Centronics type parallel printer).

The opening menu offers the following options:

- Run Procedure
- Use Calculator
- Get System
- Create System
- Load and Run

Whatever option is chosen, the new menu pops up (in a different colour) overlaid on the previous

menu, so that if 'Create System' is chosen for example, and then 'Edit Form' from the Create System menu, the previous two menus can still be seen.

Menu options are chosen by using the function keys F1 moves to the top of the menu, F3 to the previous option, F4 to the next option and F5 is delineated by the go key. The **RETURN** key is disabled. I can't understand why they didn't use it, thereby freeing F5 for a different function, but there you are. Apart from the opening menu, the top option is always 'EXIT', which returns you to the previous menu.

Up and running

The calculator facility is not remarkably powerful, performing simple arithmetical (plus minus, multiplication, division, square root) from left to right on up to 26 variables. Brackets cannot be used to supersede the left-to-right order for calculations. Nor can the variables be assessed from within the rest of the program.

Each record can consist of up to two forms: the first limited to one screen (24 lines of 40 characters, including field names), the second any variant of 66 lines of 90 characters (eg 132 lines of 40 characters). The cartridge Magpie forms were both 512x80 – one of the few places where the Micro version is less powerful than the original.

The second form is also used for reports on the database.

Alphanumeric field data areas are defined by typing in capital letters, for example **AAAAAAAAAA** or **BBBBBBBBBB**; and numeric fields (such as telephone numbers) by small letters – **aaaaaaaaaa** or **bbbbbbbbbb**.

Maximum record length is 950 characters including field names on the 24x40 form, or 5280 on the

66x80 form. That means you can have up to 26 alpha fields and 25 numerical fields on any record form. Each field can be up to 255 characters long.

So a typical mailing list form might have the following layout:

Name	NNNNNNNNNNNN
Address	AAAAAAAAAAAAA
Town	TTTTTTTTTT
County	CCCCCCCCCCCC
Postcode	PPPPPPPPPPPP
Telephone	9999999999
Remarks	RRRRRRRRRRRR

Save and search

Form layouts can be saved to disk and all the existing names can be listed, either to replace them or avoid accidental over-writing.

Systems can be password protected, though this can create problems, not so much in forgetting passwords (it's a good idea to use something fairly unforgettable, such as your own name) but because it's also possible to get locked out of a system by an 'invalid password' error message when you want to do something new it happened to me.

Searching for records is not as easy as with some other databases. For instance, in Superbase sequential searches on key fields or matches are available from a top of the screen menu, but this is only possible because the very powerful procedures language is used.

This takes time to learn, but since the most frequently needed procedures are fully documented, and learning procedures is actually the best way of getting the most out of the system this is a necessary and valuable chore.

Procedures

A procedure is created from the Edit Procedures' option of the Create System menu. The left-hand side of the screen is cleared for the creation of text, and menus are displayed on the right half. First the name of the procedure must be typed in, preceded by a single quote eg 'search'. Sub-procedures (or subroutines) are named with a double-quote opening, eg "body".

Other commands can be menu-selected, even the names of forms to be accessed, which come up from the disk directory on the Select Form/File menu. This is an almost foolproof way of programing, though the exact wording of the commands may seem strange to those raised on Basic, which can result in the following sort of sequence for a yes/no choice:

Enter Yes or No

Enter Another?

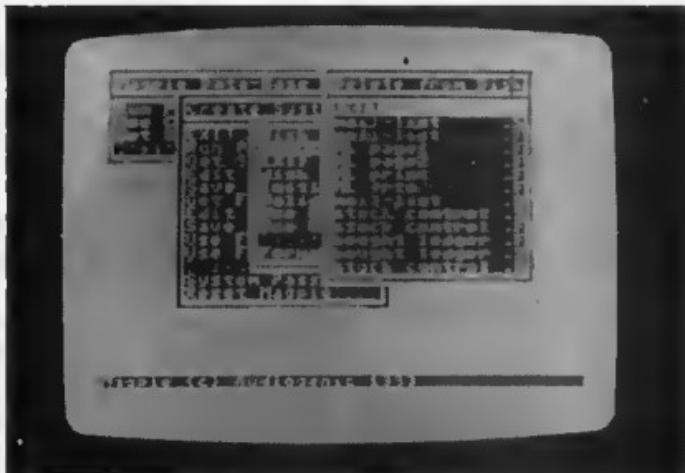

Was skip

A search procedure is fairly self-explanatory:

Thus it will be seen that in a 17 line program, only two items, the name of the procedure and the prompt, have to be typed in. The rest are generated automatically either directly from menus, or from disk directories scanned from within a menu.

Documentation

The cartridge Magpie was briefly documented, with all

the various help screens, menus reprinted in full and presented in a tough ring binder.

Disregarding that well-known maxim, "If it ain't broke, don't fix it", they've rewritten the manual for the disk version, and used it to replace the documentation for the cartridge version, too.

Fortunately, though it's presented in a totally different

way, the new manual is good, too. The old one wasn't indexed, a cardinal sin in my book, but I found it fairly easy to get around despite this significant lack.

The new one wasn't printed at renew time, and I had to work from some advance proofs, so there may be an index in the finished book. However, I found it harder to get around without one.

The stock control system is more than adequately documented, making it fairly easy for the user to adapt for specific needs.

Conclusions

I have to play off one program against another, but it was inevitable that I compare it with Superbase despite the (now) disparity in price.

I actually prefer Superbase, not so much because its programming capability is more sophisticated (which it is), but because it's easy to use after reading only the first few pages of the manual. If the procedures stump you, then you won't be able to use Magpie.

It's really a case of try before you buy. A database needs more time to choose than a word processor, believe it or not. Allocate at least as afternoon, visit a shop which has both, and is prepared to give you adequate time to evaluate each.

But, if it's value for money you're after, Magpie has got to be the software bargain of the year.

More memory for business?

A look at the new Commodore 8296

by Karl Dallas

The memory of business computers is getting larger by the day; to the extent that 128K of RAM is now being regarded as the minimum for a 'true' business machine. So Commodore has beefed up the memory capacity of its 8096 range from 96K to 128K and has called the resulting machine the 8296. Apart from that, they look identical.

Overjoyed by the 8296's potential, Karl Dallas went out and bought one, but found that actually using it qualified his initial enthusiasm.

The launch of a 128K version of the 'Business Pet', previously limited to 96K in its now discontinued 8096 version, must have been greeted with joy by many who, like me, were pushing hard against the limitations of the 96K memory. And the push was coming from within software houses, too.

Tom Grantham of Precision Software, told me, for instance, that he was hoping to be able to rewrite Precision's excellent SuperOffice so that it was able to switch memory between word processing, database and spelling checker without any reLOADing. (The present version offers you word processing plus a database, or wps plus spelling checker, and to get from the latter to the former you have to quit the program and reLOAD.)

He has decided not to, for the simple reason that the 'extra' 32K is virtually inaccessible to anyone but a hacker prepared to fit jumper wires all over the insides of his pretty new machine. I doubt that many business users are inclined in that direction.

Let me quote what Tom tells me. "The extra 32K of RAM resides behind the basic kernel area and is controlled by the user port. However, writing to the user port could cause the machine to lose its basic or kernel inadvertently. Therefore the machine as shipped will not allow the use of the extra 32K RAM."

"A deliberate act on the part of the user will allow the RAM to function; a number of links inside the machine have to be made by wire, or better still by a DIP switch."

These links allow 32K RAM switching via 4K blocks, and can specify a 'power on' condition for slots 'B' and 'A'. These slots are normally empty, but can be fitted with utility/security ROMs. Power-on can be set to use the RAM in this area, giving the user the option to softLOAD ROMs."

A call to Commodore at their new Corby technical enquiries number (0838 205252) confirmed that Tom knew what he was talking about. "It will, however, run all 8096 software with no trouble," said the lady in Corby. And that according to Commodore's Gail Wellington, was the major consideration.

new machine had to be able to run the wealth of existing 8096 software. (Despite that, it is rumoured that Handic is adapting Calc Revolt to take advantage of the increased capacity?)

Now, we computer writers lead a fairly charmed life, getting access to expensive machines and software free of charge, and one could normally print a large warning, *caveat emptor*, in whatever medium one had access to, and pass on to the next subject with a laugh of gey abandon.

If you detect a rather different tone to what I've written so far, it's because, attracted by the

possibilities of 128K to power my business, I actually went and bought one of these 128K machines. And though I get a hefty journalist discount, I still feel rather sore about it.

Pros and cons

However, the good news is that the 8296 does perform exactly like the old 8096 and the new Porsche-styled look, originally created for the now discontinued 700, with detachable keyboard and a really nice key action, results in a very classy piece of equipment.

Under review

Description: 128K micro computer
Supplier: Commodore

Commodore
Attractive, friendly version of the popular 6086 business machine, but with 32K extra memory that's treacherous to get at.

Price: \$21.24

If you team it, as I did, with the new low profile 8200 disk drives, which give you faster access times and double-sided disks (and therefore twice as much data per disk), work becomes rather like driving a powerful sports car that raises eyebrows whenever you pass.

A warning, incidentally, about the drives. They are less efficiently ventilated than the old square versions, and I found the panting papers on top - I know you shouldn't, but I expect everybody does - caused the drives to hang up until I turned off the disks and let them cool down.

This raises in my mind a possible problem about the 82560, the version with integral disk drives. I used to get hold of a review sample, to see how well it performed during extended use, because I'd have thought the drives would overheat much more when sandwiched between the neatly laid-out CPU and the VDU, but since I'm still waiting, I can't say.

(And Commodore has just announced that it is giving away \$85 worth of software with the 6296D. That lot amounts to three applications packages—the SuperScript word processor

complete with spelling checker, The Manager database and file management package, and Handic's Calc Result spreadsheet. Commodore dealers are selling the lot for £1,690 (excluding VAT).

Documentation

The documentation is really bad even by Commodore's standards. The 8096 was supplied with an 8032 manual plus duplicated supplement; that new one also comes with an 8032 manual (illustrated by the old lm-box shaped machine, in which the way of getting into it and the chip layout is different, the Porsche body hangs at the back instead of the front) plus the 8096 supplement plus an 8296 supplement.

This makes one wonder if Irving Gould is really serious about wanting to service 'all classes' with Commodore kit, or whether he's decided that only 16-bit architectures (a la the forthcoming badge-engineered

Hyperion) or Unix (as in the promised 28000 machine) will satisfy the business market, and he's not really bothering until they're available.

If that's what he thinks, than in my humble subversion, he's wrong. I've actually got a Hyperion, and it's a sweet machine in its own way, but I'm writing this on my 8295, despite the fact that the 16-bit machine has 2½ times the available

Conclusion

I like working on the 8236, and even if it doesn't have more memory than my old Pet-shaped 8096, it's still a nicer machine to use, with its detachable keyboard and tilting-and-swiveling VDU. At the price I paid, I suppose I shouldn't really complain.

But if I'd paid nearly a grand for an 'upgrade' that wasn't, I might feel somewhat aggrieved.

Can you afford to write for anyone else?

Leaders in Computer Games require
programs and programmers

- 1 Original game programs for the Spectrum or Commodore 64 are urgently required:-
Arcade, Strategy or Adventure. We pay top royalties or tailor a contract to suit your needs - WorldWide sales ensure the best possible deal
2. Programmers to work in 280 or 6502 assembly language for contract work or translation coding - best rewards.

FLAMMABLE

SIZZLING! SHATTERING!! sensational!!! No, but seriously...

Do you ever find the sharp edge of technology just a bit too sharp for comfort? The Great News! There is always going to be more wonderful than the ones before, yet somehow we find ourselves swept on tawdry. Next Year's Model without even getting to use this one the way we wanted.

In 1986 we were way ahead of our time. We had the audacity to suppose that people would buy low cost computers because they wanted to use them, not just sit idly and program them. It took no stroke of genius to guess that they'd rather pay less for programs that did more. It seemed almost obvious that the programs should be easy to use without being limited. And finally, though expert in other fields, users would need our help or advice sometimes.

Well in 1986 there are still many who want no more from macros than the challenge of impossible odds. We'd do more than that then we'd knock the Times crowsnest off clanging forever. But we're glad to say that more and more users are discovering Simple Software, and we're proud to say that many of them come to us just to tell us how pleased they are with the programs they bought. We know it's recognition value. So we'll use drug a line with known names, and invite you to ask for details of these and more.

SIMPLY ADMIN Payroll Records (PSET 40/80 col) £50
SIMPLY ASSEMBLE Mac Package (Pet, 64 disk/tape) £22
SIMPLY FILE DRMS (Pet 40/80, 64) from £20
SIMPLY RECOVER Disk Utility (3050, 4040, 3940) £12
SIMPLY WRITE Word Processor (All, disk/tape) from £35

All prices plus VAT, but excluding post and packing. We offer excellent terms to dealers/distributors. UK or abroad.

So you think you How to complain about duff products

by Charles Christian

As far as the laws of the land are concerned, anyone who buys and uses a computer for a hobby or out of educational interest is lumped together in a general category of people known as 'consumers'.

Now, it can lead to desperate problems when a business computer system goes down, leaving a company "in the lurch" as regards its data processing requirements. But it can be just as annoying for an enthusiast to discover that the computer system he or she has spent a lot of money on will not work. Indeed, the blow to someone who has painfully saved up enough money out of a meagre pocket-money allowance to buy something like a 64 may be considerably harder to bear than for a well-heeled businessman who has perhaps paid many thousands of pounds more on a system.

Fortunately, though, consumers do have rights - rights which frequently are far more generous than those enjoyed by businessmen making non-consumer purchases. But do you actually know what these rights are?

Commonsense might suggest that if your computer system does not work, all you have to do is take it back to the supplier you originally bought it from and demand your money back. But is life and the law really as straightforward as that. Read on, and you'll find out...

The starting point with this subject has to be the 'contract' for the sale of goods between you and the trader who supplies you with them.

You may have read about long, complicated legal documents spelling out lots of elaborate "terms and conditions". In fact these are totally unnecessary for consumer transactions - word of mouth is good enough. To be precise the moment you offer to buy, say, a light pen and the trader accepts your money, you have all the factors present that are necessary to create a legally binding contract.

It therefore follows that if the trader takes your money and then fails to come up with the goods, the trader is legally in the wrong. He is acting "in breach of contract". And unless some form of settlement can be agreed, ultimately you will be entitled to sue for financial compensation known as 'damages' in a court of law.

Almost a fact of life you'll find that (legal necessity or not) most traders - especially when you're buying hardware - will issue you with a formidable set of terms and conditions in writing. Such things are known as "express" terms.

Regardless of what they may or may not claim, such terms are not legally binding unless they are brought to your attention before the contractual transaction is completed.

Implications

Further, even if you are aware of the terms, the trader is still not permitted to deprive you of any of your "statutory rights". Without getting too bogged down in the legal minutiae, the most important statutory rights are a set of three implied contractual terms spelled out in the 1978 Sale of Goods Act.

These implied terms are in effect promises made by the trader to you about the quality of the goods you are buying. No matter what may be down on paper, any court of law that considers your case will automatically read these implied terms into the contract - thereby crediting them with as much importance as if they had been formally spelled out in writing.

In a nutshell the three implied terms are:

- that the goods are fit for their "usual use". In other words if you buy a cassette deck for a Vic or a 64 you are entitled to assume that it will actually run soft ware programs. On the other hand, you cannot complain if your floppy disks start to suffer when you treat them as table mats, in no way can you be said to be using them for their "usual use".
- that the goods are of a proper "merchantable quality". If you

(User's)

I know your rights?

buy something as "new" it should be in perfect condition and not shop soiled. Similarly, if you get an electric shock off the equipment, there is obviously something wrong with it - and so you to complain that the item is not of "merchantable quality". * **that the goods are "as described".** Thus a stock control program specifically described as catering for 1,000 different categories of goods should be capable of holding 1,000 categories. Otherwise the program is not "as described" and the trader is once more in the wrong.

Although wrapped up in legal terminology, these implied promises cover the three most frequently encountered problems likely to face a Commodore user - "the thing doesn't work properly"; "the thing is of poor quality", and "although there is nothing wrong with it, the thing is not what I asked for".

Fortunately, the courts do not expect you to learn the law in great detail. And, as long as the facts in your case broadly fit in with these principles you are in the clear.

And on to practical matters

Having dealt with the theoretical background to consumer goods for the next matter to consider is the practicalities of defending your rights when something does go wrong.

Mention has been made of suing people in court but in fact litigation should always be seen as the final step, only to be taken after all other approaches have failed to be of use.

So faced with, say, a defective gadget to plug into the back of your C1M computer, just what steps should you take?

* **against the trader:** the first step to do is complain, as many traders will quite happily come to

terms if a reasoned (as opposed to an hysterical or abusive) complaint is made of them. Always make your complaint without delay and don't give up easily. If necessary send a written complaint to the trader. And if you still get no satisfaction, write to the trader's head office, their suppliers or to Commodore itself - most of them will be keen to ensure that only reputable companies are involved with their products.

Assuming the trader accepts responsibility, what can you expect?

The trader may offer you a free repair. Although there should be no real reason why you shouldn't accept such an offer, bear in mind that you are under no legal obligation to do so.

Likewise a trader may offer to exchange the goods. Once more, you may accept a replacement; and it is probably the most convenient thing to do. But again, you are under no legal obligation to do so.

What you are actually entitled to in law is "damages" - in other words, cash compensation for any loss the purchase of the defective item may have cost you. Thus for example, if the gadget is so defective that it causes your main processor to blow up in your face you can also claim the cost of replacing or repairing that.

Alternatively you are entitled to get your purchase money refunded - which is possibly the most frequently sought after remedy.

But the main rule is - act swiftly. If you wait six months before claiming the law may deem you to have "accepted" the goods; which means that your legal rights are considerably curtailed. The legal rationale is that the longer you have something, the more likely it is that any faults it contains are due to natural "wear and tear" rather than to some inherent fault.

Finally, before leaving the subject of remedies altogether, watch out for a trader offering you a "credit note". When you are entitled to a full refund you can insist on it being in cash.

Court in the Act

Assuming you can reach a settlement with the trader, all your problems are over. If not, you are going to have to resort to litigation.

bearing in mind the average cost of Commodore systems, it will usually be possible to pursue this by bringing what's called "ordinary action" in a County Court. The upper ceiling on claims of this sort is £5,000, after that cases have to be dealt with in the High Court.

And where the claim involves no more than £500, there are in addition two legal rules which make life a lot easier for any do-it-yourself lawyers. To begin with, for small claims of this sort both sides have to bear their own legal costs - so even if you lose, you will not be landed with a big bill to pay to the trader's lawyers. And secondly, these small claims are dealt with in informal "arbitration" hearings; those are far less daunting for the amateur than a full-blown trial before a judge.

Before getting around to litigation, you may well find that the trader in question has done a bunk - this can often be a problem with mail-order suppliers. Or alternatively, may be in dire financial straits - lawyers describe such people as being "men of straw" - so as to not make it worthwhile to sue them. Fortunately these alternatives exist:

* **Against the manufacturer:** in the course of normal events, because your contact is with the trader he is the only person you can sue for breach of contract. If the trader was merely acting as a dealership capacity, though, he was selling products on the retail market which have been manufactured by someone else and in certain circumstances it may be possible to seek compensation from, or even sue, the manufacturer directly.

This can arise where the manufacturer supplies a "guarantee" or "warranty" with the product, as this is construed in law as being a separate contract - this time between you and the manufacturer direct, thereby cutting out the middleman. Bearing in mind that a company like Commodore is most certainly not a "man of straw" it may often be more worthwhile if you have a guarantee, to go straight for the manufacturer.

* **Against a magazine:** whilst a company like Commodore may be sound enough, smaller gadget

manufacturers and software houses have an annoying tendency for being unstable. Mail-order suppliers are the most unreliable, and in many instances if your dispute is with someone of this sort you may have to reconcile yourself to a complete write-off.

On the other hand, it may turn out that the magazine or newspaper that carried the mail-order advertisement runs a compensation scheme for readers. These are purely voluntary affairs - indeed they can best be regarded as public relations exercises - yet the basic principle is that anyone who has sent money to an advertiser who subsequently defaults can claim compensation from the publisher.

* **Against the credit supplier:** finally, if the item that is the centre of the dispute was bought with the assistance of a credit card like Access or Barclaycard, you will be relieved to know that under Section 75 of the Consumer Credit Act 1974, the "credit supplier" may also be liable for the goods.

So instead of pursuing an action against a possibly insolvent trader, you have the option of suing a well-heeled bank for compensation.

Surprisingly few people seem to be aware of this very powerful provision. It's worth bearing in mind however that the credit supplier is only liable if the cash price of the goods was between £30 and £10,000. The upper limit should cause few problems but the lower one will mean that the suppliers of some of the smaller CEM-type accessories and ROM or cassette-based software will probably fall outside the scope of Section 75 measures.

Last words?

Faced with the defective product, most consumers' first reaction is either to be upset or to have a stand-up row with the manager of the shop where it was originally bought.

In fact there is no reason to panic.

You do have legal rights - plenty of them. And, not only are there a number of different approaches you can adopt, but you can pursue them against a number of different people. The secret is to tackle each one in turn in the methodical way until finally you reach the point of commencing legal action as a last resort.

So, if the thing won't work - don't be a wimp: go and do something about it!

The Anatomy of the Commodore 64

The Book:	<i>The Anatomy of the Commodore 64</i>
The Authors:	Steve and Alan Abacus
The Publisher:	Abacus Books
The Supplier:	Software World
The Price:	£11.99
The Contents:	Commodore 64

The 1541 is one of the least understood of the Commodore peripherals – a lousy manual, dotted with mistakes and omissions, leaves people under-utilising what can be a flexible add-on. Many people are content only to LOAD and SAVE programs and sequential files, little realising the power available through use of relative files, and the direct access commands.

Well, the good news is that all these, and more, are dealt with adequately in an easily-understood style in this book from Abacus. As well as explaining the ordinary DOS commands the book goes on to explain relative files, the direct access commands and the internal structure of a 1541 diskette – the block availability map, the directory, and so on.

Many useful utility programs are given. These programs are an education in themselves, demonstrating many of the commands dealt with. The Disk Monitor program in particular is excellent – it allows easy editing of individual disk sectors, useful for partitioning up messes disks.

The authors even document the 1541 TEST-DEMO disk programs, including the DOS wedge, giving the instructions for use that Commodore forgot...

For the really keen, the authors also give a fully commented disassembly of the DOS 2.5 ROM, discovering a new command in the process.

This book I recommend to anyone who has got lost in the 1541 user's manual, or those of you who want to utilise your disk drive to the full.

This book has never strayed more than a few feet away from my 64 since I got hold of it. It really is a goldmine, aimed particularly at the Machine Code Programmer, and it's full of useful routines.

Half the book is occupied by a disassembly of the Basic and Kernel ROM. The disassembly is very well documented, and switches between hex, ASCII and disassembly as appropriate for jump tables, command word lists and programs. It is easily the best disassembly for the 64 I have seen, so good that I would have bought the book for it alone.

However, this book has more to offer. The first chapter deals with machine code programming on the 64, giving many useful tables of ROM calls, and devoting a lot of time to I/O from machine language. Other chapters deal with the advantages of assembly language as opposed to pure machine-code programming – the 64's hardware and memory configurations, and the workings of the Basic interpreter, including how to expand Basic – with working examples.

Three chapters deal with individual chapters are the SID (mainly sound), the VIC (graphics) and CIA (I/O).

Thankfully, there is very little material in this book which is likely to be in half the books on your bookshelf – such as the standard appendices packed with all too familiar tables and diagrams.

It's a pity this book is so expensive, but it costs just as much to buy in the USA. Even taking the price into consideration, I strongly recommend this book to anyone who wants a 'good anatomy' book for the 64.

Saxon Computing FIGARO 64

for
commodore 64

Much more than a business graphics package or spreadsheet, FIGARO 64 is a powerful numeric database system for maintaining fees of numbers and their descriptive data plus hi-res graphics and screen dump option. Easy-to-use menus provide built-in statistics, calculating routines, and even seasonal forecasting with full data security.

Features include:
Create New File, Open File, Close File, Disk Directory, New Series, Copy Data, Shift Data Left, Shift Data Right, Add, Subtract, Multiply, Divide, Cumulate, Display Data, Print Data, Enter Data, Amend Data, Mean, Harmonic Mean, Maximum, Minimum, Range, Moving Totals, Moving Averages, Standard Deviation, Correlation Coefficient, Growth Rates, Dual Line Charts, Mixed Bar & Line Charts, Circular Bar Charts, Pie Charts (all with Text and Hi-Res Graphics mixed on the screen), Screen Dump or Graphics or Save for Slide Show Option.

Ideal for Sales, Marketing, Finance, Education, Local Authorities, Biology, Meteorology and many other applications.

£86.25
inc VAT and P&P

Supplied on disk with a comprehensive manual complete with worked examples

Mail Orders, Access and Barclaycard to:
Saxon Computing,
3 St. Catherines Drive, Leconfield,
Beverley, North Humberside HU12 7NT

*Tommy's
Tips*

TOMMY'S TIPS

Tommy is Commodore User's resident know-all. Each month he burrows through a mountain of readers' mail and emerges with a handful of choice queries. The result, before you is a wedge of priceless information and indispensable advice. There's even the odd useful tip as well.

Dear Tommy, I have had my Vic-20 computer for four months now, and I seem to have a problem and was wondering if you could help me.

A couple of days ago I bought two books to help me use my Vic. It is when I try to program the games listings into my Vic, that my problems occur, and it happens with any long program.

What happens is that when I have reached the end of the program and listed it there are lines missing. It seems as though the computer will not accept the lines.

When I was trying to program a game in, I had got halfway through it when I got an UNDEFINED STATEMENT ERROR message, and I hadn't even finished programming yet alone typed RUN or LIST. And when I tried to type in two lines, one line never came up in the listing no matter how many times I typed it in and the other gave a SYNTAB ERROR message even though it was the same as the line given in the book. I am writing to you because I don't know who else to turn to.

I assume that the programs you are attempting to put in are not just too large, but assuming they are all ones which should fit into the available memory then it sounds very much as though you have a faulty RAM chip in the computer. Do you sometimes have trouble with the Vic not powering-up correctly (you get garble on the screen)? If so, this is almost certainly a faulty chip. There is a way you can test this; enter the following program and run it (do not put in any of the spaces except inside quotes). It will tell you if any RAM address is

not functioning correctly. You may have to run it several times since faulty RAMs can be very intermittent, sometimes working correctly and then failing for no apparent reason. If your computer fails the test even once take it back to your dealer for repair.

```
10 PRINT"(CLR)"  
20 FOR A=4253 TO 7673  
30 X=PEEK(A);PRINT A;  
40 IF X=0 THEN  
45 POKE A,0  
50 IF PEEK(A) <> THEN  
50 GOSUB 100:GOTO 80  
60 POKE A,285  
70 IF PEEK(A) <> 255 THEN  
70 GOSUB 100  
80 POKE A,X;PRINT"(CUR  
UP)":NEXT A  
90 END  
100 PRINT" FAILED":RETURN
```

If you have any memory expansion then you should alter the loop values in line 20 as follows:
+3K - change first value to 1182.
+8K - change first value to 4768 & second value to 16383
+16K - change first value to 4768 & second value to 24578
+24K - change first value to 4768 & second value to 32767

(The reason the test does not start at the very beginning of the BASIC area is that you must not disturb the program itself which occupies 157 bytes.)

Dear Tommy, My problem is mixing graphics on the Vic-20. It is easy enough to just print or use the POKE commands to get one of the graphics on the keyboard, but I would like to get complicated graphics, like those on games that you buy. I have a switchable 16K expansion.

I would also like you to recommend a good programming book for a Vic-60 with 16K expansion (switchable) suitable for a 16-13 year old.

What you have to do is to design your own characters on an 8x16 grid and then tell the computer to use your character set instead of the normal one. To start with, you need to transfer the existing character set into RAM so that you can play around with it; this also ensures that

you don't get garbage on the screen when you swap between the two. This is done as follows:

```
10 POKE 52,28:POKE 82,28  
20 CLR  
20 FOR A=7158 TO 7679:POKE  
A,PEEK(25600+A):NEXT  
70 POKE 38888,255  
80 END
```

You can now replace any of the characters with the design of your choice. The characters are made up of 8 rows of 8 dots; each character is therefore stored as eight bytes in memory. By actually drawing your character on paper and filling in the squares to make the design, you can work out the value to be put into each byte since a filled square equals 1 and an empty square equals 0; the resulting 1s and 0s make up a binary number, for example 00111100 = \$40, thus is the value you would need to POKE into the relevant memory location. All 8 rows are totalled in the same way, giving you your new character. A small program will illustrate it much better.

```
30 FOR A=1 TO 3  
40 READ CH:FOR C=C TO  
CH+7  
50 READ V:POKE C,V  
60 NEXT C,A  
70 PRINT"(CLR)":TAB(96);  
"(JT)":TAB(84)  
100 DATA 2206, 0, 0, 1, 30, 53,  
33, 3, 1, 7  
110 DATA 2206, 0, 248, 38, 38,  
28, 255, 288, 240  
120 DATA 2388, 2, 8, 14, 253,  
255, 288, 0, 9
```

Run this with the first part; a small yet fighter will appear on the screen. By expanding the data statements in groups of eight, you will see how the characters are made up (the first value is the start address of the relevant character); you can then follow the same method to design whatever you like. One restriction with using your own character set is that you can only move it to the RAM which is permanently in the machine (ie not any expansion area). This causes slight problems when using more than 8K expansion, but has no effect when using 8K extra since you can still reserve space at the top of memory. To regain the nor-

mal character set type POKE 38888,255

On your second query I am not sure whether you want a book to tell you how to program on the Vic or one to learn Basic programming in general. If the former then VIC-20 User Guide by John Heileman and Ron Talton is as good as any and if it is a Basic tutor you are after then you are rather spoilt for choice. Illustrating Basic by D. Alcock costs £3.25 and is a good book although not for any particular machine. Commodore have a couple of good learning packages: Getalk and the Microplus (£12.95) and Introduction to BASIC (Part 1 and 2) (£14.95 each), while Honeydome have the excellent Dr Watson Basic course, but there are a number of others equally suitable.

Dear Tommy, My father has bought the Commodore 64 Disk Drive and has given it to me to write people's names and addresses for his job - to store them on disk. I would like to know how I could print it out on the screen so the disk will save it. I would be very grateful if you could tell how you would do it.

I think I detect a little confusion here between printing on the screen and storing the data on the disk; what you need is a program which will store each name and address in a record which is then stored in a file on the disk. I suggest you purchase one of the many database programs which are designed for this very purpose.

These programs will allow you to input the information, sort it into alphabetical order, display it on the screen, print it on a printer and finally store it on a disk or cassette. Make sure you check how many records you are going to need as some of the cheaper databases are limited in the number of records per file. There is of course no limit on the number of different files you can have so this may not be a big drawback. The best method is to ask for a demonstration before you buy, so you would be better off going to a dealer rather than getting it by mail-order if at all possible.

JOBS WITH compuNet

compuNet Tele Services Ltd is a new company set up to handle all aspects of compuNet — a new communication based information and teleshopping service for the Commodore 64.

We are currently looking for a number of people to help us run the service. If you have some of the following attributes we would like to hear from you.

- A good education
- Knowledge of the C64
- A helpful and responsive telephone manner
- Administrative skills
- A flair for keyboard graphics

This could be your chance to build a career in the home information and services industry of the future. Please telephone or send details to:

John Clarke

Game for a song ... VIRGIN GAMES at £2.99

The LAUGHING SHARK told us that it won't be long till CHRISTMAS and it was time we did something about it, so, until the end of NOVEMBER, we will be selling most of our BEST GAMES at the SPECIALLY REDUCED price of £2.99 instead of the usual prices of £9.99 and £7.95 — that's a SAVING of between nearly £6.00 and £5.00 per game!

These titles ONLY £2.99 each —

	NORMAL PRICE	SAVING
Falcon Patrol	£6.95	£3.96
Hideous Bill	£7.95	£4.96
Ambush	£7.95	£4.96
VIC 20		
Mission Mercury	£7.95	£4.96
Envahi	£5.95	£2.96
Creepers	£5.95	£2.96

Falcon Patrol — A fast action and compelling game which I highly recommend. **Hideous Bill** & **Envahi** — The C64 version of the game is superb. **Mission Mercury** — It's one of the few home versions that is actually an improvement on the original VIC 20 version. **Creepers** — A very good game with lots of action and fun. **Ambush** — This game is exciting and demanding and an absolute must for any serious computer games player. **Envahi** — Playing today. **Creepers** — It's a great game.

If you buy **INFOTAPE** down to stock this **INFOTAPE** at the SPECIAL LOW price, simply send a cheque or PO for £2.99 for EACH GAME you buy plus 50p postage and packing (however many games you order) to the **GRAB IT WHILE YOU CAN** Department, Virgin Games, 2-4 Vernon Yard, Portobello Road, London W12 2DX

Software for the 64!

INFOTAPE

— the amazing value-for-money data-base system for tape users £9.95.

INFODISK

— the friendly data-base system for disk users. Note that the special offer at the price of £49.95 must finish 31/12/84 even if you have previously bought INFOTAPE.

MICROSTATS

— a comprehensive statistics package ideal for the "A" level or college student. Too many features to list. £17.95 tape £19.95 disk

BRAINMASTER

— pit your wits against the 64! An intriguing game to find the number before the computer finds yours — you can win if you're clever! Nine levels of difficulty plus colour & superb music £7.95 tape

Letters

Write away

This is your page: normally we write for you, but here we listen. Feel free to let us know what you think – about the magazine, about Commodore, about suppliers, about life, art, the meaning of existence or whatever. We don't print everything we receive, of course; but anything that might be of specific relevance or general interest will make it to these pages.

Teacher's Pet

I am head of Computer Science in a Comprehensive School that had, as other schools and colleges takes advantage of the Department of Industry scheme and purchased an IBM 380Z. The intention was to equip a Computer Centre with these machines or the slightly cheaper 480Z. However, money became tight (due to Local Education Authority cut backs and also the 'flavour of the month' changed to technology) and we were at a cost-off concession, given £100 to purchase micros. This allocation would not even buy ONE more 380Z let alone 10 which was my brief! As you will no doubt be aware the other (cheaper) machine sponsored by the DoI is the Spectrum. Having looked at the Spectrum and considered it carefully I decided that it was insufficiently robust for general use. Given the environment of even a well supervised classroom the keyboard, let alone the case, would be under constant threat of damage.

I cast around for a machine that was robust, cheap, could be expanded at a later date and had come from a good stable. I am sure it will not be any surprise that I opted for the Vic-20 and, having contacted a supplier, was able to negotiate a good deal on the quantity order. The school is now equipped with eight Vic-20s, a Commodore 64 (with disk, printers plotter, graphics tablet etc.) and, of course, the ubiquitous Z80Ms.

All the above is largely irrelevant except that it sets the scene. The Computer Centre provides 'micro power' to a large number of 'serious' users. By serious I mean people who only play video games occasionally and then are very disturbed over the cases they pack.

The School Library is now in a position to take a periodical of interest to computer users in the school and obviously they asked my advice. I spent three months buying ALL the magazines I could lay my hands on – from your better known rivals to the more obscure and esoteric publications. And now to my point, of all the magazines I bought in that three month period Commodore User was the only magazine that impressed me at all!

Years was the only magazine not to be filled with listings of pathetic programs attempting to emulate ridiculous, and all very similar, arcade games. I do not object to those people who wish to spend hundreds of pounds on sophisticated equipment merely to play Beveridge Robin or the like. Nor do I object to software manufacturers making money selling overpriced, and very similar, games to them. I do not object when people who play these games refer to themselves as programmers nor when they publish magazines in order that they can tell each other how wonderful the wretched games are I DO object when publications claiming to be respectable journals are filled with that rubbish. Having made a study of the available literature I am able to say that 99% of it is as described above.

I have taken an unprecedented step in writing to congratulate you on your own publication. The July issue was a masterpiece. The UNICOPY64 program published (without error – a rare event in other literature) was probably the most useful routine published in any magazine for some years. Jim Buttersfield is a great asset to your staff and should be retained at all costs. He has kept his high standard again in August with TINYMON. The Vic-20 I, and the rest of the Centre's Users, are grateful that at least one author and one publisher are actually interested in serious computing and are providing other people with the means to use their computers creatively.

I have a number of editions of Commodore User open on the desk as I type and the list of useful, informative, accurate and well written articles, program listings

and 'shorts' is quite remarkable. You set the standard by which I shall judge all other publications. Let me say at once that whilst there are, at the minute, noise to touch you, you must guard your growing reputation jealously – I was a little disappointed that John Ramping's, otherwise excellent, article "Using the 64's Function Keys" was published without its accompanying Basic listing. However mistakes will happen and I have no doubt that this is a mere temporary aberration. I will make no further reference to it!

Having written this unsolicited testimonial to you I need not add that my unqualified recommendation to the Library will be to take out an immediate and lengthy subscription to Commodore User. Once more my congratulations and our thanks.

A. Freedman, 99 King Georges Ave, West Watford, Herts WD1 7QE.

The other side...

I am rapidly becoming your number one fan and maybe even quicker than that.

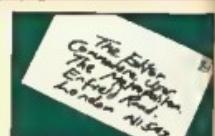

With the help of Buttersfield and the boys and excellent tips from other readers I am understanding many things most puzzling. To thank all those would take far too long so please pass that tip to them with my gratitude. Disk Drive Owners Delight

- 1 Take two new disks
- 2 Place back to back
- 3 Take Stanley knife or similar sharp object
- 4 Insert sharp object in write protect notch and make neat incision in bottom of disk
- 5 Repeat 4 until a neat square is removed
- 6 Place disk in drive and format both sides

Why disk manufacturers don't do it without charging wicked prices I don't know. It does not work well on old well-used disks, so don't waste time.

Again my thanks for a great mag.

G. Elliot, 118 Church Parade, Canvey Island, Essex.

You're quite right, it is possible to format and use the other side of a single-sided disk. But be warned: single-sided disks are usually verified only on one side. And they're probably sold as single-sided disks because they failed the double-sided test.

Inky fingers

I was interested to read in the review of the MPS-801 printer (July issue) that the ribbon on the machine has an easily replaced ink pad. I have a 1515 CBM printer and when the ribbon recently refused to make any further impression I was encouraged to experiment and discovered that the lids on the little boxes at each end of the ribbon can be easily pried off with the blade of a knife.

The right hand box is of no great interest as it contains merely some sort of tensioning device. The left hand box, however, holds the ink pad in the form of a foam rubber wheel. This is easily removed, soaked in stamp pad ink, and replaced. Maybe the ink I have is not the best for the job. At all events it is cheaper to apply some fresh ink than to pay £8.95 for a new ribbon!

R.G. Holmes, Dailies, Glen Road, Peebles EH45 8AY.

Fingers do the walking

I am writing to you to tell you just how effective your 'classified' ads are. I had put adverts in many other magazines and had no response and had therefore wasted money on the adverts. Even now I am still receiving offers for my Vic-20 and they all say it was from your magazine that they saw my advert.

COMING SOON...

**GOOD GRIEF!
WE'RE NOW
IN THE BLACK FOREST
CHATEAU**

DANGER MOUSE
*Two great new games from
CREATIVE SPARKS*

The reason why I sold my Vic was so that I could update my hardware to a Commodore 64. I think however that Commodore, like Sinclair, could have offered a trade-in deal, ie people who have Vic-20s and wanted C64s could send their Vic-20s in exchange for a 64. Thus not having to pay £200 for a 64. This way the owner of a Vic could buy a 64 at half price and at least get a trade-in on his/her old machine.

I Matthews, 25 Whitehall Road, Didsbury, Manchester.

Old Vic

I am writing to complain about your August edition.

I bought the magazine and read through it and wondered whether you had changed your name, like to Commodore User. I didn't find one feature (apart from the usual, eg games reviews, but not all of us like games) dedicated to the Vic-20 whereas the C64 had two.

Also can't you find any Vic-20 books to review? As for your joint features eg All the Fun of the Show I was virtually all dedicated to the C64.

I know the Vic-20 is supposed to be dying, but all you're doing is putting the nail in the coffin, so please, please can you increase your Vic-20 articles, and keep it that way.

Finally, isn't your magazine shrinking? (losing pages - July issue 110 pages, August 68 pages).

Apart from the August issue, it's a good fair mag.

Gary Ward, 15 Court Crescent, Kingswinford, West Midlands.

Clubbing it Down Under

I wish to let you know details of our Commodore 64 Users group, recently formed here in Lismore, for publication in Commodore User.

Name of Group:
Lismore C-64 Users Group,
c/o John Glenmuir,
Richmond Hill Rd,
Wollongbar,
NSW Lismore, 2480,
Australia.

I am very pleased to be able to buy the excellent Commodore computer magazine each month. It is one of the best magazines on Commodore Computers I have seen. I have both the C-64 and Vic-20 computers and find your articles and features very helpful and informative, especially the program listings. I sincerely hope that you and

your magazine improve over the years to come and I will certainly keep buying it each month.

Congratulations on a wonderful publication.

Bruce Greig, PO Box 385, Lismore 2480, New South Wales, Australia.

Back-up problems

I have read with interest letters in Commodore User in which readers complain about their dealings with Commodore. Perhaps my own experience will be of interest.

In January after three months of correspondence, I obtained Easy Stock. I am using that to control the parts inventory in my garden machinery repair business. The system works well, but as I find the single drive back-up program very cumbersome, I asked Commodore whether I could use two 1541 drives to automate the process.

They confirmed that this could be done by using two 1541 drives and the Copy-all utility that comes free on the 1541 Test/Demo disk.

I purchased the second drive, changed the device number to 9 (hard-wired) and attempted to make back-up copies of the Easy Stock data disk. No go.

Then followed protracted correspondence with Commodore in which they again confirmed it could be done and sent me various instructions for the use of Copy-all.

Finally, in response to a phone call from a local dealer, they admitted that Copy-all cannot copy Easy Stock data disks, something to do with the way data is arranged on the disk - way above me I'm no computer buff, I'm just a user.

From my dealings by letter and phone, I feel that Commodore treat their customers with disinterest and contempt. Letters, including recorded delivery letters go unanswered. When they are answered, it is often after a three to five week delay.

From conversations with other users and with my local Commodore dealer, I conclude that these are not isolated incidents. It appears that Commodore are swamped by the scale of business and are unable to cope with the trade they have generated.

However, if any of your experts can help with the back up problem, I would be grateful. Otherwise, who wants a cheap 1541?

Angus Stapland, The Quiller's Garth, Appledore, Ashford, Kent.

Anybody out there like to lend a hand in solving this reader's problem?

TASK SET!

THE BUG STOPS HERE!

JUST PICTURE IT!

JUST PICTURE IT - BEING ABLE TO DRAW YOUR OWN HIGH RESOLUTION GRAPHIC DESIGNS ON YOUR COMPUTER SCREEN WITHOUT HAVING TO WRITE A PROGRAM . . . !

Well, now you can - with the amazing Koala Pad from Audiogenic!

The Koala Pad touch tablet provides the direct link between you and your screen. It plugs into your Commodore 64 and lets you paint directly onto the screen with a selection of brush sizes and a choice of 16 colours and 16 shades from your software's palette.

But that's just the beginning - because every Koala Pad package includes the incredible Koala Painter software which makes it child's play to:

- Fill outlines with a colour
- Draw straight lines
- Make frames!
- Draw circles
- Plot radius from a point!
- Copy shapes!
- Create mirror images!
- Zoom in on an area
- Swap shapes between two pictures!
- Save your pictures to disk or tape!
- Move objects around!

The program is controlled entirely from the tablet by moving a cursor arrow around to the different menu option. An optional Programmer's Guide is also available to tell you how to incorporate Koala Pad pictures into your own programs.

Now you don't have to be an experienced programmer to produce real high resolution graphics on your computer - the Koala Pad from Audiogenic makes it as easy as a pencil and paper. Just picture it!

Available with Cassette or Disk software for the Commodore 64
From all good computer shops - or direct from Audiogenic - just fill in the coupon!
